PREFACE

This study was conducted by the Institute for Defense Analyses (IDA) for the Joint Staff, Director for Logistics, Health Service Support Division (J-4 HSSD) and the U.S. Army Office of the Surgeon General (OTSG) in partial fulfillment of the task entitled "Revision of NATO AMedP-8 'Planning Guide for the Estimation of Battle Casualties.'" It documents the technical basis for the biological volume of Allied Medical Publication 8 (AMedP-8), detailing the modeling tools used, assumptions made, and data produced during the original AMedP-8 effort.

The biological volume of AMedP-8 was drafted under the direction of the U.S. Army Office of the Surgeon General for eventual publication by the North Atlantic Treaty Organization (NATO) as Volume II of Allied Medical Publication 8. It was produced through a collaborative effort involving the Institute for Defense Analyses (IDA), Veridian Pacific-Sierra Research Corporation (PSR), and General Dynamics Applied Information Systems (GD-AIS).

The authors would like to thank COL George W. Korch Jr. (USAMRIID), COL Phillip R. Pittman (USAMRIID), LTC James S. Wadding (USAMRIID), MAJ Kermit Huebner (USAMRIID), Dr. Patricia L. Petitt (USAMRIID), Dr. Janice M. Rusnak (USAMRIID), Ms. Heather Park (Battelle), Ms. Shannon Frey (Battelle), LTC Mark Bohannon (J-8), Dr. Alison E. Lawrence (IDA), and Mr. Douglas P. Schultz (IDA) for participating in the review of this paper.

EXECUTIVE SUMMARY

This paper captures the technical underpinnings (including algorithms, assumptions, and data) of Allied Medical Publication 8(B), Medical Planning Guide of NBC Battle Casualties, Biological (AMedP-8 Biological). It provides users of AMedP-8 Biological an understanding of the methodology used to obtain the casualty estimates therein, as well as the underlying assumptions and limitations of those estimates.

In collaboration with Veridian Pacific-Sierra Research Corporation (Veridian PSR) and General Dynamics Advanced Information Systems (GDAIS), the Institute for Defense Analyses (IDA) completed the most recent version of AMedP-8 Biological in 2005 for the Army Office of the Surgeon General, the custodian of this NATO publication. Ratification is pending.

AMedP-8 Biological allows the user to estimate casualties by injury type and time of onset as a function of exposure and resulting performance degradation. Casualty estimates are based on a combination of tactical scenario, agent (anthrax, botulinum neurotoxin, plague, tularemia, Staphylococcal enterotoxin B, Q fever, Venezuelan Equine Encephalitis, smallpox, brucellosis, glanders, and influenza as a disease of military significance), weapon type (MRLS, bombs, TBMs, point sprayers, line sprayers), attack intensity (heavy, moderate, or light), and posture (protection unavailable or protection available). For agents that result in contagious diseases (plague, smallpox), human sources of disease introduction have also been modeled as a separate scenario, and person-to-person disease transmission has been considered for all scenarios. For influenza, human sources are the only sources of disease introduction, since this disease was modeled only as a disease of military importance, not as a weaponized biological agent. Individual protective equipment is considered for physical protection, and no medical protection is considered in any of the scenarios.

In general, “worst-case” casualty estimates have been modeled. Thus, attack parameters are based on assumptions that maximize the number of casualties and the resulting workload on the medical system, versus the number of fatalities. During the development of AMedP-8 Biological, attack locations were chosen to maximize the casualties within the targeted unit (battalion or brigade) for each combination of delivery system, attack intensity, meteorological conditions, and unit type. In addition,

meteorological conditions were chosen to result in conditions under which agent dissemination has the greatest potential for causing illness.

The developers of AMedP-8 Biological used the Naval Surface Warfare Center's Vapor, Liquid, and Solid Tracking Model (VLSTRACK), Version 1.6.1, to model the dispersion of biological agent. They then combined the output of VLSTRACK with a three-dimensional (x, y, and time) representation of a tactical unit within the BioStrike model (developed by IDA) to determine individual exposures to agents. As depicted in Figure ES-1, calculation of individual biological agent exposures in any given scenario requires several types of input data, including the tactical arrangement of units on the battlefield, agent data, delivery system and munitions data, and meteorological data.

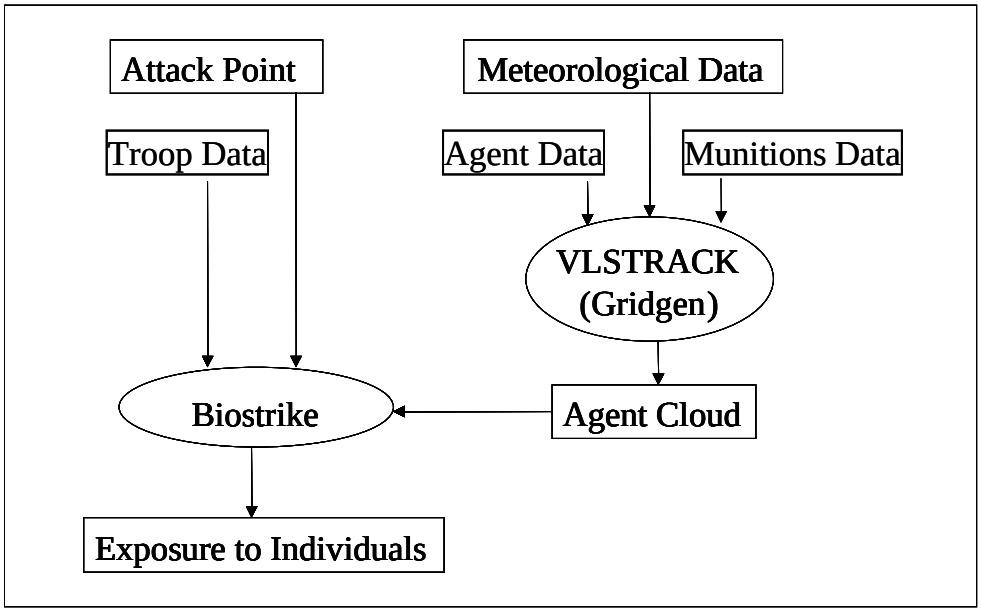

Figure ES-1. Calculation Process of Individual Exposures

AMedP-8 Biological casualty estimates are based on the evaluation of effects of single attacks against static troop formations. A scenario consists of a tactical arrangement of units on the battlefield, based on doctrinal composition. The following scenarios are modeled: Heavy Brigade, Forward Maneuver, Movement to Contact; Heavy Brigade, Forward Maneuver, Offense; Heavy Brigade, Forward Maneuver, Defense; Heavy Brigade, Brigade Support Area, Movement to Contact; Heavy Brigade, Brigade Support Area, Offense and Defense; Light Infantry Brigade, Defense; Support Brigade; Naval Task Force; Amphibious Assault Force; Air Port of Disembarkation (APOD); and

Sea Port of Disembarkation (SPOD). Within each scenario, the smallest tactical units or systems are called icons, each consisting of one or several personnel (or crew). Both the APOD and SPOD are assumed to be located within sizable urban areas, and AMedP-8 Biological provides planners with a tool to estimate local civilian casualties based on average population density in the area surrounding the APOD or SPOD.

For each tactical scenario, agent, weapon type, and intensity combination, AMedP-8 Biological provides casualty estimates due to exposure to agents for both protection unavailable and protection available cases. In all scenarios, personnel are assumed to be engaged in extravehicular activities and unsheltered at the time of attack. Furthermore, all personnel are assumed to be wearing standard battledress uniform at the initiation of attack. In the protection unavailable case, a protective mask and hood are available to reduce or prevent exposure to the agent. The protection available case was considered for all scenarios involving delivery systems typically considered overt—ballistic missiles, rockets, and bombs. Estimates do not consider performance decrement not caused by the agent, such as heat stress, fatigue, and visual decrement.

To estimate personnel status, casualty numbers, illness severity, and performance levels over time, two different methodologies were developed by Veridian PSR. This first methodology calculates performance estimates based on exposure using the US Defense Nuclear Agency's Improved Casualty Estimation model, incorporating the Intermediate Dose Program methodology. In this methodology, individuals' exposure levels are translated into signs and symptoms, resulting in performance degradation over time in the absence of medical prophylaxis or treatment. This methodology—applicable to SEB, tularemia, and Q fever—was based on existing human experimental data; for these agents, febrile illness was used as the single sign/symptom to determine performance. Therefore, estimates of performance over time provide the basis for determining the fates of individuals in the unit, if and when they become casualties, the nature and severity of illness, the period of illness, and resolution of illness—recovery or fatality. These data are then tabulated to portray the number of casualties and fatality in the unit.

For the remaining biological agents, Veridian PSR developed the Knowledge Acquisition Management Instrument (KAMI), a survey tool that gathered information from subject matter experts about diseases resulting from these agents for which only limited human exposure data was available. For each agent, the KAMI information was then used to determine illness severity categories—which grouped the symptoms exhibited at different stages of illness into categories—and to develop algorithms

describing disease progression over time, times of illness, death and recovery. Illness severity categories were used to define casualty levels on a disease-specific basis. These data were then tabulated to portray the number of casualties and fatalities in the unit. For influenza and person-to-person transmission of smallpox and plague, IDA and GDAIS collaborated in the development of an epidemic model. This model was then incorporated into the automated tool, the Nuclear, Biological, and Chemical Casualty Resource Estimation Support Tool (NBC-CREST).

In AMedP-8 Biological, for non-KAMI agents, individuals exposed to biological agents were grouped into categories based on the extent of their performance degradation according to the following criteria. Performance was defined as the ability of individuals to carry out general combat tasks. Individuals whose performance was degraded to less than or equal to 25% of original capability were considered "casualties." Casualties who recovered to greater than or equal to 75% capability were considered convalescent. In a unit, individuals who were not casualties were placed into "Capable" performance bands that reflected those who were not affected (100% capable), those who were combat effective (less than 100% capable, but greater than 75% capable), and those who were performance degraded but not casualties (less than or equal to 75% capable, but greater than 25% capable). For KAMI agents, performance was not used to define casualty and capable status. Instead, for each illness, individuals who entered a designated illness severity category based on the severity of their symptoms were considered casualties. The illness severity category that constitutes a casualty varies by agent.

This paper supplements AMedP-8 Biological with information such as the detailed layout and composition of the brigade-sized units and tactical scenarios they comprise; the doctrinal basis for tactical scenarios; estimates of the amount of exposures received by individuals in each scenario; and assumptions and calculation for the process used to optimize attack locations and select agent, munitions, and delivery system characteristics to estimate exposures. For all scenarios, this paper presents a series of tables containing exposure data generated by Biostrike. During the development of AMedP-8, this data was subsequently analyzed with the DICE/IDP methodology or the KAMI-based methodology (depending on agent); however, the performance estimate data was not available for documentation and the methodologies developed by Veridian PSR have been previously documented.

This paper also presents summary tables, which provide an overview of casualties and fatalities for each of the scenarios modeled, enabling quick overview and comparison between scenarios. This documentation effort provides an understanding of not only how

casualty estimates were produced in AMedP-8 Biological, but also their limitations in accessibility and applicability.

Over the course of documentation, accessibility and applicability were identified as two key areas for future revisions of AMedP-8 Biological. Accessibility may increase by changing the document format to include hypertext, graphical data presentation, supporting algorithms, and/or supplementary generic software. In addition, extending the information in AMedP-8 to other situations of interest will certainly expand its utility.

I. INTRODUCTION

A. AMedP-8 DOCUMENTATION OBJECTIVES

This report provides a record of the production of Allied Medical Publication 8(A), *Medical Planning Guide of NBC Casualties, Volume II – Biological* (AMedP-8 Biological),[1] in a collaborative effort involving the Institute for Defense Analyses (IDA), Veridian Pacific-Sierra Research Corporation (PSR), and General Dynamics Advanced Information Systems (GD-AIS). The authors discuss the development of AMedP-8 Biological and describe the overall technical approach, important assumptions, and supportive data.

B. AMedP-8 PURPOSE, CONCEPT, AND ASSUMPTIONS

AMedP-8 was designed as a planning guide or manual to estimate the numbers and types of casualties resulting from the military use of nuclear, biological, or chemical weapons. AMedP-8 Biological provides estimates of casualties and remaining operational strength after a single attack of either a bacterial (anthrax, plague, tularemia, Q fever, brucellosis, glanders), viral (Venezuelan equine encephalitis (VEE), smallpox, influenza), or biological toxin agent (botulism, Staphylococcal enterotoxin B (SEB)), on a brigade-size unit during an out-of-area contingency operation. These estimates consist of the number of injuries, injury type, and injury severity of individuals in various scenarios that include tactical units (brigade ground formations), ports (air and sea), naval forces, and amphibious forces. The scenarios consider military units—with or without physical protection available—that experience a single release of biological agent in the unit area.

AMedP-8 has utility across the full range of military personnel who use casualty estimates in planning and executing operations. At the time of its development, this planning guide was envisioned as being especially useful for crisis or contingency planning, when a biological weapon attack is imminent or has occurred and rapid

[1] Note that an addendum to Allied Medical Publication 8, *Medical Planning Guide for the Estimation of NBC Battle Casualties (Biological), AMedP-8(A), Volume II* (AMedP-8 Biological), titled *Medical Planning Guide for the Estimation of NBC Battle Casualties (Biological), AMedP-8(B), Volume II* was produced several years later and includes additional information and supersedes AMedP-8(A). This documentation effort refers to AMedP-8(B).

casualty estimation is necessary for response. For example, AMedP-8 would aid commanders and staffs who must assess impact on mission, select courses of action, maintain awareness, and respond to changes in battle tempo, and would aid personnel managers who must plan for replacements for killed or wounded in action (KIA, WIA), medical casualties, and/or those personnel whose performance is degraded to an extent that warrants replacement or augmentation. It would support surgeons, medical planners, and logistics managers who must plan for and respond to sudden requirements for supplies (especially medical) of unusual types and numbers.

C. AMedP-8 HISTORY

The history of AMedP-8 Biological begins with the development of AMedP-8 Nuclear. Although the current revision of AMedP-8 Nuclear was first conceived in 1992, its basis was established 30 years earlier with the US publication of *A System for Estimating the Medical Load in Nuclear Warfare* on December 14, 1959, by the Walter Reed Army Institute of Research. This new methodology allowed the user to estimate, given the size of a unit and the yield and offset distance of a nuclear weapon, the fraction and types of injuries that would result. It assumed that personnel in the unit were uniformly distributed in an ellipse centered on the offset distance and of the same size as the unit area. At the time of publication, fewer than 15 years after Hiroshima, the US classified the casualty estimation methodology SECRET, and released only 50 copies. This effort eventually evolved into AMedP-8 (AMedP-8 Nuclear),[2] which pertained specifically to nuclear casualties until 1996.

In 1994 the baseline methodology developed by the Defense Nuclear Agency's Intermediate Dose Program (IDP) was extended from nuclear effects to chemical and biological weapon effects.[3] The Defense Nuclear Agency's Improved Casualty Estimation (DICE) methodology extended the modeling of performance degradation from nuclear weapon effects to include the effects of chemical and biological weapons.[4] The researchers made the simplifying assumption that performance degradation is equivalent for a given severity level of a symptom, without regard to the causative agent for that symptom. For example, they considered nausea and vomiting similarly debilitating whether caused by exposure to radiation, poisoning by a nerve agent, or illness caused by a pathogen or toxin. Given this assumption, the next step entailed

defining the symptoms resulting from chemical or biological exposure from symptoms equivalent to those caused by nuclear weapons. Upon defining these symptoms, they could calculate performance degradation. Symptoms with no nuclear equivalent required additional research along the lines of that performed in the development of IDP.

Even with the IDP and DICE models, knowledge of the diseases of interest in biological defense was inadequate to accurately model casualties. Veridian Pacific-Sierra Research Corporation (PSR) conducted extensive research to identify available data to model the relationships between dose and time of onset and disease course, types and intensity of symptoms, and eventual outcome. For diseases with unavailable or insufficient data, PSR devised the Knowledge Acquisition Matrix Instrument (KAMI),[5] an expert polling tool that was used to evaluate clinical and laboratory experience with humans and research animal models. This effort extended the casualty models to the range of diseases cased by biological agents and other diseases of interest to the North Atlantic Treaty Organization (NATO).

Following these research efforts, the US proposed a new AMedP-8 revision in 1996: the addition of Biological and Chemical casualty estimation as volumes II[6] and III[7] to the *Medical Planning Guide of NBC Battle Casualties, Volume I – Nuclear.* The new volumes built upon the concepts introduced in AMedP-8 Nuclear and expanded them to include chemical and biological agents, appropriate delivery systems, and (in Volume II – Biological) additional tactical scenarios. The user of the manual, given some estimate of the types of agents and delivery systems to be used, and the type, posture, and mission of the military unit of interest, could estimate not only resulting casualties by illness severity categories and time of onset, but also the performance capability of unit members as a function of time after exposure.

D. AMedP-8 REVISION TIMELINES

The traditions and practices of NATO govern revision and ratification of AMedP-8. Within NATO, the Nuclear, Biological, and Chemical (NBC) Medical Working Group (NBCMedWG) is tasked with developing doctrine and procedures relevant to the medical protection and treatment of military personnel exposed to NBC agents. The NBC

7 STANAG 2477 NBC/MED, *Medical Planning Guide for the Estimation of NBC Battle Casualties (Chemical)*, AMedP-8(A), Volume III.

Defense Staff Officer of the US Army Office of the Surgeon General (OTSG) serves as the US Head of Delegation for the NBCMedWG and, as such, represents US positions and interests. Outside of the regular meetings of the NBCMedWG, the United States also is Custodian of NATO Standardization Agreements (STANAGS) for the estimation of casualties resulting from the use of NBC weapons. One of these STANAGs is AMedP-8 Biological, numbered 2476. Titled *The Medical Planning Guide of NBC Battle Casualties*, AMedP-8 is presented in three volumes: Volume I, Nuclear (STANAG 2475); Volume II, Biological (STANAG 2476); and Volume III, Chemical (STANAG 2477). The Custodian is responsible for maintaining the STANAG in a current and relevant form and reviewing it at least once every 3 years. The Custodian sponsors Custodial Meetings to formally review documents, and all interested Allies participate. Study Drafts propose revisions to the STANAGs and circulate among the Allies for comment. After member nations reach the consensus that the revised STANAG is complete and correct, the Secretary of the NBCMedWG submits this Ratification Draft to the NATO Army Board for distribution, review, implementation, and ratification. Upon approval of ratification, the STANAG is promulgated when two-thirds of the member nations agree to implement it.

The division of AMedP-8 into three STANAGs was based on the 1996 guidance of the NATO Army Board. The Board instructed the NBCMedWG to separate nuclear, biological, and chemical casualty estimation into different STANAGs. The US, as Custodian, presented the proposal for the development of AMedP-8 Biological to NATO in 1996, followed by Study Draft 1 in 1998, followed rapidly by Study Drafts 2, 3 and 4. These drafts were reviewed by the US and other NATO nations. Issues of classification, methodology, and content were resolved in the review process, and the Ratification Draft was distributed to the Army Board in December 2000. In 2005, one nation (Netherlands) chose not to ratify AMedP-8 Biological, while it was ratified by 13 nations (Belgium, Canada, Denmark, Germany, Greece, Hungary, Italy, Luxembourg, Poland, Spain, Turkey, United Kingdom, United States). AMedP-8 Biological, STANAG 2476,[8] was promulgated on 7 May 2002.

Subsequent to the ratification, Allied nations requested consideration of additional agents. They also required the consideration of human-to-human transmission of infection, when appropriate. Hence, the addendum to Allied Medical Publication 8,

[8] STANAG 2476 NBC/MED, *Medical Planning Guide for the Estimation of NBC Battle Casualties (Biological)*, AMedP-8(A), Volume II.

Medical Planning Guide for the Estimation of NBC Battle Casualties (Biological), AMedP-8(A), Volume II (AMedP-8 Biological) added glanders, smallpox, and brucellosis, as well as human-to-human disease transmission estimates for the contagious diseases (smallpox, plague, influenza).[9] The Addendum effort logically expanded the delivery sources for contagious biological agents to include casualty estimates resulting from human sources of exposure, infected persons who introduce and spread contagious disease during a military operation. Casualties resulting from influenza were also estimated. Influenza was considered as a disease of military significance, although it is not generally regarded as a biological warfare agent. The Ratification Draft of the addendum, STANAG 2476 NBC/MED, *Medical Planning Guide for the Estimation of NBC Battle Casualties (Biological),* AMedP-8(B), Volume II, circulated among the NATO nations for review and comment in April, 2005. It is currently awaiting ratification.

[9] IDA and General Dynamics Applied Information Systems (GD-AIS) collaborated to produce the addendum, STANAG 2476 NBC/MED, *Medical Planning Guide for the Estimation of NBC Battle Casualties (Biological),* AMedP-8(B), Volume II.

II. APPROACH AND OVERVIEW OF AMedP-8 BIOLOGICAL

A. APPROACH

As the third and final volume of AMedP-8 to be developed, AMedP-8 Biological reflects the same underlying philosophy and approach of AMedP-8 Nuclear and AMedP-8 Chemical regarding assumptions, tactical scenarios, attack details, casualty estimation methodology, and presentation format of estimates.

In the development of both AMedP-8 Chemical and AMedP-8 Biological, IDA and PSR collaborated to produce scenario-based, time varying casualty estimates.[1] In that development effort, IDA used a parallel methodology to develop agent exposure estimates for individuals in the Chemical and Biological scenarios. Based on IDA's exposure estimates, PSR determined estimates of performance degradation over time and tabulated resulting casualties for each scenario in AMedP-8 Chemical and AMedP-8 Biological.

AMedP-8 Biological considers four additional tactical scenarios beyond the seven tactical scenarios in AMedP-8 Chemical and AMedP-8 Nuclear. It also considers additional delivery systems relevant to agent dissemination in biological warfare scenarios. Similar to AMedP-8 Chemical, three attack intensities are considered for each type of delivery system, and the availability of physical protection is also considered when applicable. Also, similar to AMedP-8 Chemical, AMedP-8 Biological optimizes meteorological conditions and attack locations to result in the largest number of casualties entering the medical system.

B. OVERVIEW

AMedP-8 Biological provides casualty estimates resulting from single attacks occurring individually in a given scenario. Thus, in general each scenario consists of an agent/ tactical formation/ delivery system/ intensity combination. Furthermore, for some (overt) delivery systems, the availability of physical protection is also considered, resulting in a combination of agent/ tactical formation/ delivery system/ intensity/ protection status combination. For each contagious agent another variable, "with contagion," is considered, resulting in the combination: agent/ tactical formation/ delivery

[1] Note that GD-AIS replaced PSR during the production of the Addendum to AMedP-8 Biological.

system/ intensity/ protection status/ contagion status. All delivery systems are considered for all tactical scenarios, except for the naval task force scenario. This unit is assumed to operate beyond the range of some delivery systems, such as artillery. Estimates of casualties resulting from attacks with these delivery systems have not been provided.

Influenza poses an exception to the combinations described above. Since influenza is not considered to be a biological agent, but rather an infectious disease of operational significance, aerosol dissemination is not modeled. Instead, exposure via human sources of exposure is modeled in all influenza scenarios. The disease spreads solely through person-to-person transmission, eliminating the need for the "with contagion" variable. Protection is not available in these scenarios, since an undetected source of infection is present. Thus, the influenza scenarios can be described with the combination: tactical formation/ intensity.

In AMedP-8 Biological, casualty estimates were calculated using modeling methods and assumptions to maximize the load on the medical system, or the number of casualties entering the medical system. This was done by maximizing the number of individuals with illness-inducing exposure who would be expected to become casualties. Attack locations and meteorological conditions were chosen in adherence to this "worst case" objective.[2] The optimization processes are discussed further in Section IV of this paper.

C. ASSUMPTIONS

AMedP-8 Biological was designed to serve as a single reference that leads the user to a table or to a cell in a table that provides a supportable estimate of casualties resulting from the unique combination of unit, mission, and weapon of interest. The assumptions made in its design and development must be clearly understood to allow for

[2] In AMedP-8 Biological, attack locations and meteorological conditions were chosen using a Probit methodology to maximize the number of individuals expected to become ill in any given scenario. In AMedP-8, though, a casualty is defined as someone whose combat performance degraded to less than or equal to 25% capable. In most cases, individuals who become ill will also become casualties at some point after the onset of illness. However, for agents with relatively low lethality, like Q fever, a relatively large fraction of those who become ill will never be ill enough to meet the AMedP-8 definition of casualty. The casualty tables do track these individuals as well as casualties, so users can assess the overall effects on unit performance in these cases. While users should be aware that AMedP-8 distinguishes between being ill and being a casualty, and that some of the calculations underlying the casualty tables are based on probability of illness, for practical purposes this distinction has a minimal effect, if any, on the outcome of the calculations and the estimates presented in AMedP-8.

proper use of the casualty estimation tables.[3] The most significant of these assumptions are broached here. Specific characteristics of tactical formations, agents, delivery systems, and meteorology can be found in Section III of this paper.

1. Biological Agents and Diseases of Interest

Weaponized biological agents of interest (each discussed in detail in the appendix noted below) are assumed to result in inhalational forms of disease; other manifestations of illness are not considered. The estimates in AMedP-8 Biological are based on biological agent effects data calculated for healthy young men weighing approximately 70 kilograms, thus pertaining specifically to military populations. All personnel are assumed to breathe at a standard resting rate of 15 liters per minute. AMedP-8 also includes person-to-person disease transmission for the contagious agents. For each operational scenario, AMedP-8 Biological also presents a limited set of casualty estimates for influenza infection, considered a contagious disease of operational significance.

- Causative agents of bacterial diseases:
  - anthrax (Appendix A)[4]
  - plague (Appendix C)
  - tularemia (Appendix D)
  - Q fever (Appendix F)
  - brucellosis (Appendix I)
  - glanders (Appendix J)
- Causative agents of viral diseases:
  - Venezuelan Equine Encephalitis (VEE) (Appendix G)
  - smallpox (Appendix H)
- Biological toxins:
  - botulinum neurotoxin (Appendix B)
  - Staphylococcal enterotoxin B (SEB) (Appendix E)

2. Tactical Formations

Casualty estimates are based on scenarios consisting of brigade-sized ground formations, forces at ports (air and sea), and naval and amphibious forces. Detailed

[3] Note that this paper does not provide comprehensive information regarding the assumptions used in the development of the human response models and their application to AMedP-8 Biological. This work was performed by the Veridian Pacific-Sierra Research Corporation (PSR), which has separately documented its effort (see Sections V and VI of this paper for a summary of the PSR work and references). The human-to-human transmission modeling was conducted by IDA in conjunction with General Dynamics Applied Information Systems (GD-AIS). The assumptions made in that work are discussed in Section VII and documented in more detail elsewhere (see Section VII for references).

[4] Note that the order of the Appendixes reflects the order of agents presented in AMedP-8 Biological.

descriptions of the scenarios are presented in Appendix K and sourced Table of Organization and Equipment (TOE) information can be found in Appendix M of this document. The 11 tactical formations considered in AMedP-8 Biological involve ground forces, naval forces, and strategic targets; units are configured for out-of-area operations. The formations are listed here an elaborated in Section III.A of this paper:

- Heavy Brigade, Forward Maneuver, Movement to Contact
- Heavy Brigade, Forward Maneuver, Offense
- Heavy Brigade, Forward Maneuver, Defense
- Heavy Brigade, Brigade Support Area, Movement to Contact
- Heavy Brigade, Brigade Support Area, Offense and Defense
- Light Infantry Brigade, Defense
- Support Brigade
- Amphibious Assault Force
- Naval Task Force
- Air Port of Disembarkation (APOD)
- Sea Port of Disembarkation (SPOD)

The Brigade Support Area is assumed to be the same for both the offense and defense missions. Both the APOD and SPOD are assumed to be located within a sizable urban area.

3. Terrain

The effects of topography and vegetation are not modeled; urban, forested, or mountainous terrains are not considered. Attacks against ground forces assume a barren terrain; for forces at sea, estimates are developed for attacks over water. Forces are dispersed over relatively large areas. The terrain is modeled as a flat, table-top terrain characterized solely by surface roughness length. Two different surface roughness lengths are used to represent barren terrain and water, as appropriate to the scenario.[5]

[5] The version of VLSTRACK that was used characterized various types of terrain by their generally associated surface roughness length. Whereas in AMedP-8 Chemical all terrain was characterized as "sand," with an associated surface roughness length of 0.001 meters, in AMedP-8 Biological all terrain was characterized as "barren," with an associated surface roughness length of 0.01 meters. This difference in characterization was based on the differences in the sets of meteorological data used to determine the "optimal" meteorology in each document (see Section IV of this paper for more information on meteorology optimization). In the development of AMedP-8 Chemical, SAIC looked only at conditions prevailing in the desert; in AMedP-8 Biological, IDA looked at conditions from

4. Delivery Systems and Attack Intensities

AMedP-8 Biological considers the following delivery systems: aerial bombs, tactical ballistic missiles, artillery, ground line source sprayers, aerial line source sprayers, and point source sprayers. For each of these delivery systems, AMedP-8 considers attacks of varying intensity consisting of light, moderate, or heavy, by varying the number of volleys or sub-munitions per attack or amount of agent in the device. Only single attacks of a single agent are modeled (not mixed fires or mixed attacks). The casualty estimates assume typical heights of function for each delivery system as determined by a subject matter expert.[6] Weapon delivery systems and other methods of disease introduction are summarized here:

- Three types of munitions with conventional analogs: Multiple Rocket Launch Systems (MRLS); bombs; and tactical ballistic missiles, with both bulk payloads and submunitions.
- Aircraft- and ground-vehicle-generated line sources—aerosols disseminated along a movement path—of varying lengths.
- A small, man-portable, stationary aerosol sprayer
- For smallpox and plague, disease was also introduced to a military population via human sources—individuals in the contagious phase of a disease. This type of disease introduction pertains to two possible situations, either inadvertent spread via contact with civilian or host nation personnel, or deliberate spread as a covert attack.

The attack intensities are characterized as "light, moderate, or heavy." Each delivery system is assumed to be capable of delivering light, moderate, or heavy attacks:

- For agent delivered by MRLS a light attack is delivery of two hundred forty 122mm MRLS rockets (one volley from one battery of 6 launchers, each with 40 rockets). A moderate attack is delivery of 480 122mm MRLS rockets (one volley from two batteries of 6 launchers each, each with 40 rockets). A heavy attack is delivery of seven hundred twenty 122mm MRLS rockets (one volley from three batteries of 6 launchers each, each with 40 rockets).
- For aerial bombs a light attack is delivery of two 500 kg bombs by a single aircraft. A moderate attack is delivery of 6 500 kg bombs (three aircraft, two bombs per aircraft). A heavy attack is delivery of 12 500 kg bombs (six aircraft, two bombs per aircraft).

---

different locations worldwide (see Section IV). Overall, IDA concluded that "barren" was the best general representation for those locations.

6 "Typical height of function" refers to the height generally recommended in doctrinal publications.

- For TBMs, a light attack is delivery of one TBM with a warhead containing about 500 kg of agent. A moderate attack is delivery of three TBMs with each warhead containing about 500 kg of agent. A heavy attack is delivery of five TBMs with each warhead containing about 500 kg of agent. Both unitary and submunition warheads were modeled for TBM attacks.
- For air or ground line sources, a light attack is the release of 1 kg of agent per kilometer. A moderate attack releases 5 kg/km, and a heavy attack releases 10 kg/km. This results in light, moderate, and heavy attack intensity releases of 10 kg, 50 kg, and 100 kg of agent (respectively) for a 10 km long line source (air or ground); and 100, 500, or 1,000 kg of agent (respectively) for a 100 km long line source (air or ground). Since the bulk density of agents (mass per unit volume) can vary, the volume of agent released as a line source may differ across agents; however, the mass is constant.
- For man-portable sprayers, a light attack is a single release of 2.4 kg of agent, while moderate and heavy attacks are releases of 4.2 kg and 7.2 kg, respectively.
- For those diseases that can be transmitted from human to human (plague, smallpox, and influenza) exposure, scenario intensities are a function of the disease type: for plague light, moderate, and heavy exposure scenarios are initiated by 1, 3, or 5 persons, respectively, while for smallpox and influenza light, moderate, and heavy human-to-human transmission scenarios begin with 1, 5, or 25 persons, respectively. These numbers generally reflect the relative ability of each disease to rapidly incapacitate an infected individual source of disease (based on course of illness, infectious period, and time of symptom onset).

In AMedP-8 Biological, attack locations are optimized to produce the greatest number of casualties within the targeted unit (battalion or brigade) for each combination of delivery system, attack intensity, meteorological conditions, and unit type. Section III provides more detail about the attack location optimization process. Aerial sprayers, ground sprayers, and man-portable sprayers are all assumed to deliver agent "off target"—at a location outside the boundaries of the targeted unit. Rockets, bombs, ballistic missiles, and human sources of exposure are all assumed to deliver agent "on target"—within the boundaries of the targeted unit.

5. Physical and Medical Protection

AMedP-8 Biological also takes into account the availability of individual physical protection. The major assumptions regarding physical protection are summarized here:

- All personnel are assumed to be engaged in extravehicular, unsheltered activities at the time of the biological attack.
- Personnel have not been warned or prepared to expect a biological attack.
- Only individual physical protection is considered, and two cases are addressed—protection unavailable and protection available.
- All personnel are trained to don individual protective equipment within a certain time limit; they don a protective mask and hood within 1 minute and an overgarment, overboots, and gloves within 9 minutes.
- Personnel are assumed to receive complete protection from donned individual protective gear.

In AMedP-8 Biological, in all scenarios personnel are assumed to be engaged in extra-vehicular activities and unsheltered at the time of attack. Furthermore, all personnel are assumed to be wearing standard battledress uniform (BDU) at the initiation of attack. In the protection unavailable case, referring to military individual physical protection, personnel are assumed to be exposed to the agent due to entry via the respiratory tract. In the protection available case, a protective mask and hood are available to reduce or prevent exposure to the agent. The protection available case was considered for all scenarios involving delivery systems that are typically considered overt, or observable by human means—ballistic missiles, rockets, and bombs. For line sources and man-portable sprayers—typically considered covert—detection and warning are assumed to be unavailable; personnel exposed in such attacks do not have an opportunity to don masks and avoid exposure. In the protection available case, it is assumed that immediately following the attack, all personnel don the mask within 1 minute of the attack. Thus, exposure occurs for the first minute of attack until the mask has been donned. Once donned, the mask is assumed to provide complete protection against further exposure, and all personnel are assumed to have their equipment available and wear it correctly.

The assumptions made about the time it takes to don protective equipment derive from individual skill set standards and assume that all forces are trained to meet these standards. They are conservative estimates since they assume all personnel utilize the maximum amount of time to don equipment. If a soldier has ready access to his equipment, it may only take a few seconds to put on a mask. At the same time, these casualty estimates optimistically assume that protective equipment fits properly and provides complete protection, and that all soldiers have their equipment available and don it correctly. In addition, estimates don't consider performance decrement not caused by

the agent, such as heat stress, fatigue, and visual decrement. On balance, these assumptions are intended to provide a reasonable approximation of the effects of protective equipment.

AMedP-8 Biological assumes that personnel in all scenarios have not been vaccinated, and that they have not received any medical prophylactic treatment prior to exposure. Furthermore, post-exposure medical treatment is also not considered in any of the casualty estimates.

6. Meteorology

Meteorological conditions are modeled as resulting in the "worst-case," defined as conditions under which agent dissemination has the greatest potential for causing illness. The modeling of meteorology is discussed further in Section IV and Appendix L.

Temperature, local attack time, wind speed, wind direction and cloud cover are based on meteorological data collected over a 1-year period from five locations worldwide. Worst-case conditions may vary with type of agent because of various agent factors. Factors such as the number of organisms per unit mass of bulk agent, the agent dissemination efficiency, and the aerosolized agent decay rate greatly affect atmospheric concentrations of viable agent over the target area.

Since weather is a key determinant of the potential hazard resulting from biological agents, the estimates in AMedP-8 Biological are based on an assessment of combinations of temperatures, wind speed, prevailing wind direction, cloud cover, and sunrise/sunset times. These combinations were determined by an assessment of 105 different sets of meteorological data, drawn from five different locations worldwide. For each meteorological data set, agent clouds were modeled using five different biological agents and nine delivery systems. These total dosage clouds were then overlaid on a uniformly distributed population grid—100 by 100 kilometers with one person per square kilometer—to compare relative area coverage and agent density. Meteorological conditions are chosen based on those data sets that consistently provided the largest number of casualties (and not fatalities) for each agent.

7. Casualty Definition

Units are assumed to execute their missions even after an attack by a biological weapon. It is assumed that the operation requires all but the most injured personnel to continue fighting. An exposed individual must be significantly incapacitated to be evacuated for medical care. The performance of an exposed individual must be degraded

to less than or equal to 25% of original capability for him or her to be considered a "casualty" and enter the medical system. However, once an individual is defined as a casualty, he or she must recover to at least 75% of original capability before he or she can leave the medical system and be considered "convalescent." Thus, AMedP-8 Biological assumes that personnel do not return to duty upon recovery, unlike AMedP-8 Nuclear and Chemical, which include a "return-to-duty" category instead of "convalescent."

D. ANALYTIC TOOLS

IDA and PSR used various analytical tools to estimate casualties in AMedP-8 Biological. For all but the human vectors, the US Navy's Vapor, Liquid, and Solid Tracking (VLSTRACK)[7] computer model was used to simulate the aerosol dissemination of agent from the time of initial release until the cumulative concentration of viable agent fell below a dose equaling one-thousandth of the dose estimated to affect 50% of exposed individuals. The VLSTRACK model estimates the concentration of agent over time at points on a geographic grid. Amount of agent, type of delivery system, atmospheric stability, and wind speed are the primary determinants of downwind and crosswind hazards. The output of VLSTRACK is then overlaid on a three-dimensional (x, y, time) representation of a tactical unit within the BioStrike model developed by IDA to determine exposure of individual troops located at various points on the grid.[8] This scenario-specific estimate of individual troop exposure is used as input to generate military performance estimates. The performance estimates are calculated using the U.S. Defense Nuclear Agency (DNA) Improved Casualty Estimation (DICE) model, incorporating the Intermediate Dosage Program (IDP) methodology. The DICE/IDP[9] model uses VLSTRACK dosage estimates to project casualty numbers, illness severity categories, and performance levels over time (see Section IV for a discussion of the casualty estimation methodology).

Casualty estimates in AMedP-8 are restricted to military personnel due to the assumptions of individuals' susceptibility to illness. The estimates in AMedP-8 Biological are based on biological agent effects data calculated for healthy young men weighing approximately 70 kilograms who are assumed to breathe at a standard resting rate of 15 liters per minute. However, since both the APOD and SPOD are assumed to be

---

7 Timothy J. Bauer and Roger L. Gibbs, 1995.

8 Flythe, 2000. The use of the BioStrike model requires agent dispersion data reported in a specific format; to streamline the methodology, IDA developed a variant of VLSTRACK, called Gridgen, to report the outputs of VLSTRACK in a BioStrike-compatible format.

9 McClellan et al., 1998.

located within a sizable urban area, civilians living in the vicinity will be vulnerable to any biological agent attack against these facilities. Thus, AMedP-8 Biological also provides planners with a tool to estimate local civilian casualties based on average population density in the area surrounding the APOD or SPOD. This process is described further in Section IV.D of this paper.

III. INPUTS FOR BIOLOGICAL EXPOSURE ESTIMATION

Figure III-1 demonstrates the flow of data leading to the production of casualty estimates. Agent, delivery system, and meteorological data were used by the IDA variant of VLSTRACK, Gridgen, to model the agent cloud. The agent cloud was then input into BioStrike and, together with attack points and troop array files, was used by BioStrike to determine the biological agent exposure of individuals in each scenario.

Calculating agent exposure at the individual level for all scenarios considered in AMedP-8 Biological requires various types of data to input into computer models; some data are collected as basic data elements and some are calculated in intermediate steps. Figure III-1 describes the process by which individual agent exposures are calculated for the AMedP-8 Biological; input data and output data are shown as boxes, while analytical tools are shown as ovals. These include information on the tactical arrangement of units on the battlefield (Troop Data), information on agent characteristics (Agent Data), information on the characteristics of delivery systems (Delivery System Data), and meteorology features (Meteorological Data).

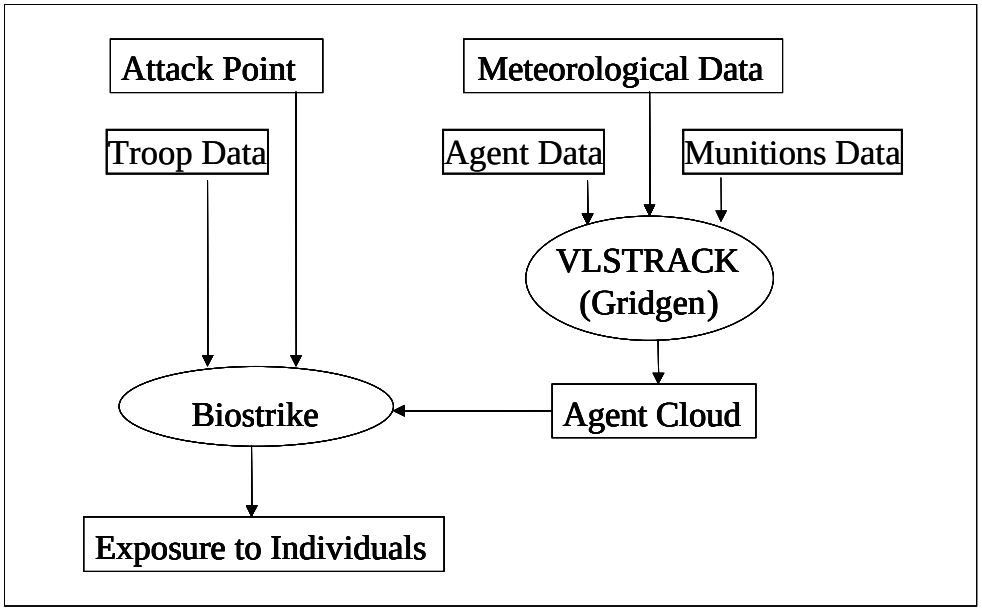

Figure III-1. Calculating Individual Exposure Estimates

The casualty estimation approach used to develop AMedP-8 Biological begins with determining agent exposure at the level of the individual or group of individuals

(called "icon," see below) based on their location on a grid. This section describes the methodology used to estimate biological exposure for icons in each scenario. Section IV goes on to discuss the methodology for using these exposure estimates to determine performance degradation and casualty estimates.

A. INPUTS FOR BIOLOGICAL EXPOSURE ESTIMATION: TROOP LAYOUTS

1. Tactical Arrangement of Units on Battlefield

As mentioned in Section II, AMedP-8 Biological relies on scenario-based casualty estimation. Each scenario consists of a tactical arrangement of units on the battlefield, based on doctrinal composition.[1] Within each scenario, the smallest tactical units are called "icons," each consisting of one or several personnel (called "crew"). Icons are distributed on a grid in each scenario, and icon numbers correspond to gridpoint numbers. The scenarios are discussed in greater detail below and in Appendix K. Appendix K contains detailed information about each scenario, including the numbers and positions of personnel on the battlefield. Different parts of Appendix K refer to different scenarios, as indicated in the sections below.

a. Heavy Brigade

The Heavy Brigade consists of six battalions and other assigned elements. The battalions are two mechanized infantries, one armor, one self-propelled artillery, one mechanized engineer, and one support battalion. Assigned elements include air defense, intelligence, military police, and smoke generators. The Heavy Brigade is depicted performing three missions: movement to contact, offense, and defense. The formation and separation among units and systems varies in each of the tactical missions.

The Heavy Brigade personnel manning level used in this document is 4,042 personnel, which includes supporting units such as air defense. There are 443 armored vehicles, 778 wheeled vehicles (trucks), and 9 motorcycles. Of the armored vehicles, 76 are main battle tanks or their derivatives; the remainder are armored fighting vehicles, howitzers, mortar carriers, etc. Within the truck category, there are 252 light utility (equivalent to the US HMMWV), two hundred twenty-four 5-ton cargo, and one hundred forty-four 8-ton cargo. In the scenarios described below, trucks predominate in the

[1] Please see Appendix M for tables of organization and equipment (TOEs) referenced to develop the scenarios.

brigade support area and armored vehicles predominate in the maneuver area. All vehicle mixes in the targets were assigned as they would be in the appropriate combat situation.

The area occupied by the Brigade is small relative to the area coverage of biological weapons. Additionally, casualty estimates do not account for protection provided by trucks and other forms of shelter; personnel are assumed to be unsheltered at the time of the attack. Casualties are estimated for different areas of the Brigade targeted: the maneuver battalions or the brigade support area.

Maneuver battalions are targeted in the following scenarios

- Heavy Brigade, Forward Maneuver, Movement to Contact
- Heavy Brigade, Forward Maneuver, Offense
- Heavy Brigade, Forward Maneuver, Defense

The brigade support area is targeted in the following scenarios

- Heavy Brigade, Brigade Support Area, Movement to Contact
- Heavy Brigade, Brigade Support Area, Offense and Defense

The Heavy Brigade and its tactical scenarios are briefly described here; further details can be found in Appendix K, Tables K-1.1 through K-5.2 and Figures K-1 through K-5.

The Forward Maneuver Task Forces are targeted for attack in the scenario "Heavy Brigade, Forward Maneuver, Movement to Contact," while the Brigade Support Area Task Force is targeted in the scenario "Heavy Brigade, Brigade Support Area, Movement to Contact." The Tank Battalion Task Force is targeted in the scenarios "Heavy Brigade, Forward Maneuver, Offense," and "Heavy Brigade, Forward Maneuver, Defense," but the Brigade Support Area Task Force is targeted in the scenario "Heavy Brigade, Brigade Support Area, Offense and Defense." The process for determining locations for attack is described in Section IV.C.

The tactical scenarios of the Heavy Brigade are detailed below.

<u>Heavy Brigade, Forward Maneuver, Movement to Contact</u>

The Brigade is deployed with two battalion task forces moving on line and a third task force deployed on line across the width of the brigade (see Figure III-2, below, and Appendix K, Figure K-1). The support elements follow next. Scouts, ground surveillance radar, and some combat engineers are leading forward of the two task forces on line. The direct support artillery battalion has one battery traveling with each task

force. The direct support engineer battalion has one company moving with each task force. Air defense and smoke generator assets are located with each task force and the support formation. Within this formation, all companies and batteries are traveling deployed on line.

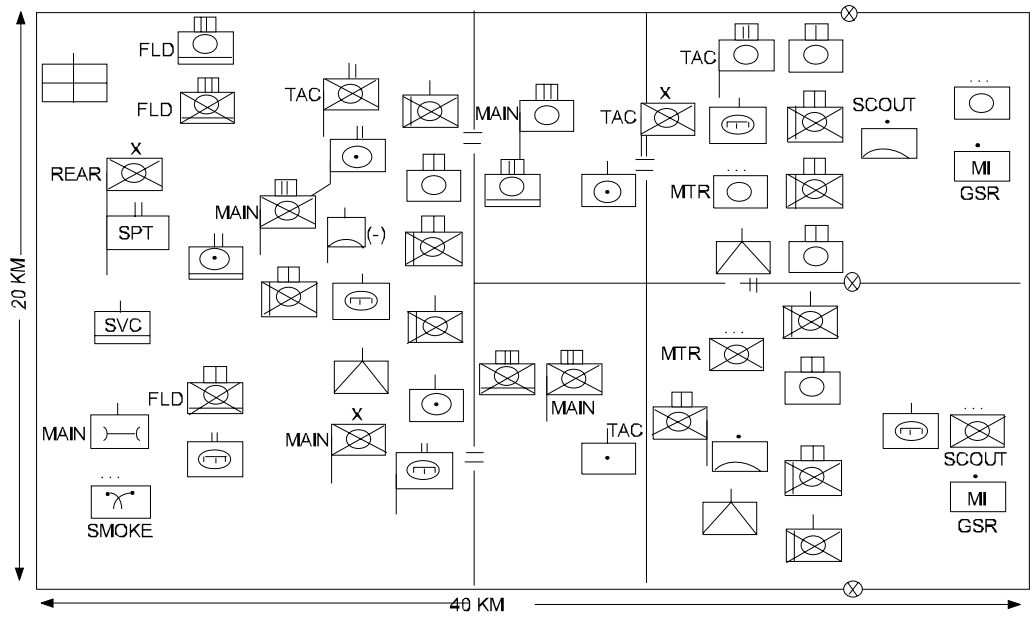

Figure III-2. Heavy Brigade, Forward Maneuver Battalion and Brigade Support Area (Movement to Contact)

Table K-1.1 describes the brigade, at the icon level of detail, in tactical arrangement; Table K-1.2 provides similar information for each icon, arranged by icon number. These tables display all icons in the heavy brigade and are not limited to those in the Forward Maneuver Battalion targeted in this scenario. Figure K-1.1 provides a tactical layout of these icons, labeled by task force; included are the Mechanized Infantry Battalion 1, Mechanized Infantry Battalion 2, Tank Battalion Task Forces, and Brigade Support Area. Figure K-1.2 focuses on the Forward Maneuver Battalions only.

Heavy Brigade, Brigade Support Area, Movement to Contact

In movement to contact, elements that constitute the brigade support area are moving in convoy behind the third task force of the brigade, as shown in Figure III-2 and in higher resolution in Appendix K, Figure K-2, which provides a tactical layout of this scenario. These elements consist of the brigade support battalion, the logistical elements of all the maneuver battalions, the brigade main command post, and the support battalion

command post. Air defense assets are integrated into the formation. Most of the units are deployed in multiple parallel columns.

Table K-2.1 describes the brigade, at the icon level of detail, in tactical arrangement; Table K-2.2 provides similar information for each icon, arranged by icon number. Figure K-2 provides a tactical layout of this scenario. Note that corresponding icons (in terms of function) are assigned different icon numbers in the movement to contact scenario, compared to the offense and defense scenario.

Heavy Brigade, Forward Maneuver, Offense

Figure III-3 shows that the Heavy Brigade in the offense comprises three battalion task forces on line and a brigade support area. This array presents four basic target areas (three battalion task forces with support and a brigade support area), three of which are essentially identical. The battalions are well-dispersed and present individual targets within the brigade area. Thus, the detailed casualty assessment is presented for a battalion task force and the brigade support area.

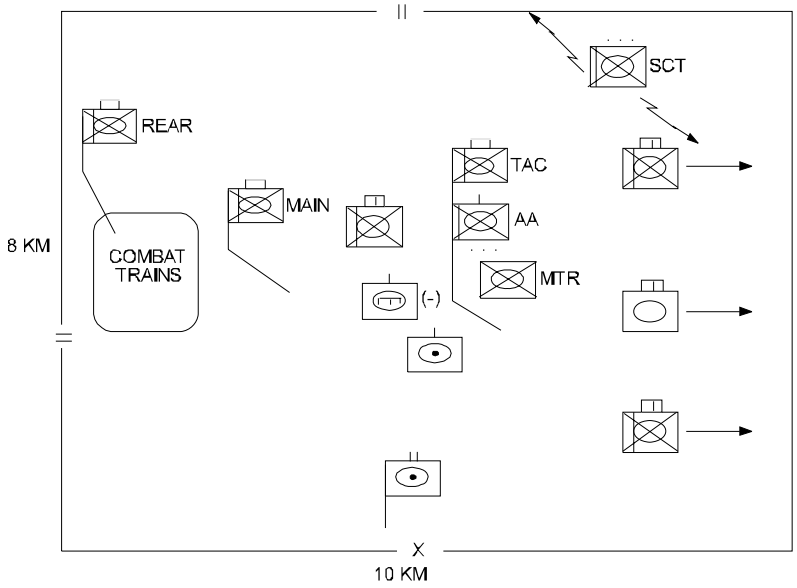

Figure III-3. Heavy Brigade, Forward Maneuver Battalion (Offense)

Appendix K, Figure K-3, shows a schematic of the unit deployment. The maneuver force target comprises three company teams on line, with scouts on both flanks. Behind the teams, the battalion mortars are deployed in two sections. A direct support artillery battery is deployed in three groups—two firing platoons and a battery headquarters. An engineer company is also in direct support. The majority of the

engineers are maintained in the company formation. The battalion retains a reserve company team and a separate combat trains area. There is a main battalion command post and a tactical command post. The tactical command post is more forward. The battalion anti-armor company is divided among the reserve, center, and right flank teams as anti-armor platoons. Air defense and smoke generator assets are integrated into elements of the formation. Table K-3.1 describes the brigade, at the icon level of detail, in tactical arrangement; Table K-3.2 provides similar information for each icon, arranged by icon number.

Heavy Brigade, Forward Maneuver, Defense

As deployed for the defense, the Brigade again provides four elements that may be targeted: three battalion task forces and a brigade support area; a battalion-size reserve is not maintained in this situation. As discussed above, this layout provides two basic formations for casualty estimation, targeting a maneuver unit or the brigade support area. The maneuver unit is described here and a schematic is provided in Figure III-4 and in higher resolution in Figure K-4; the brigade support area is described below.

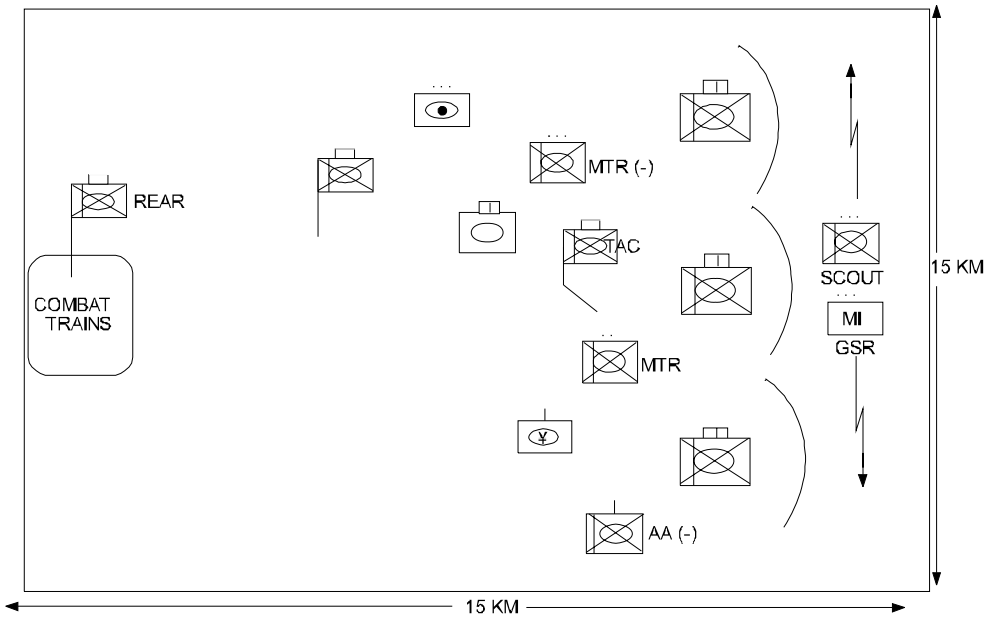

Figure III-4. Heavy Brigade, Forward Maneuver Battalion (Defense)

In the defense, company teams are not formed; therefore, the armor company is maintained. The battalion is deployed with scouts and ground surveillance radars forward of the main defensive positions. Four companies are deployed on line and one is maintained in reserve. The anti-armor company is not attached out but employed as one

of the companies in the main defensive position. The armor company is designated as the reserve. The direct support artillery battery is deployed as two platoons with the battery headquarters collocated with one of the platoons. The battalion mortar platoon is divided into two sections. There is a main command post, a tactical battalion command post, a combat train area, and a combat engineer company. Air defense and smoke generator assets are integrated into elements of the formation. Table K-4.1 describes the brigade, at the icon level of detail, in tactical arrangement; Table K-4.2 provides similar information for each icon, arranged by icon number.

Heavy Brigade, Brigade Support Area, Offense and Defense

The Brigade Support Area was assumed to be the same for both the offense and defense missions. The support area is established along a supply route and units are deployed as shown in Figure III-5, below, and Appendix K, Figure K-5, which provides a tactical layout of this scenario. The bold outline in these figures indicates the unit boundaries.

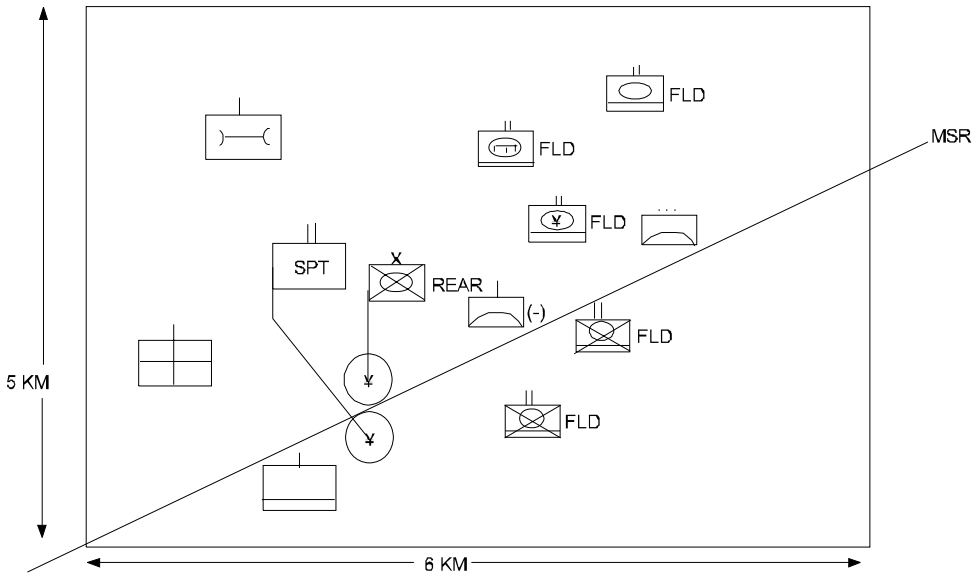

Figure III-5. Heavy Brigade, Brigade Support Area (Offense and Defense)

The support area units include logistical elements for food, maintenance, supply, limited ammunition, transportation, and medical. Also located in the brigade support area are logistical elements of the brigade's organic maneuver battalions. These are two mechanized infantry, one armor, one mechanized engineer, and one self-propelled artillery battalions. The brigade rear headquarters and support battalion headquarters are also located here. An air defense platoon and company headquarters provide point

defense from air attack. Table K-5.1 describes the brigade, at the icon level of detail, in tactical arrangement; Table K-5.2 provides similar information for each icon, arranged by icon number. Note that corresponding icons (in terms of function) are assigned different icon numbers in the movement to contact scenario, compared to the offense and defense scenario.

b. Support Brigade

The Support Brigade is patterned after a combat service support formation that could support at least one heavy division. As shown in Figure III-6, the units are stationary and deployed along a main supply route (see Appendix K, Figure K-6, for a higher-resolution schematic).

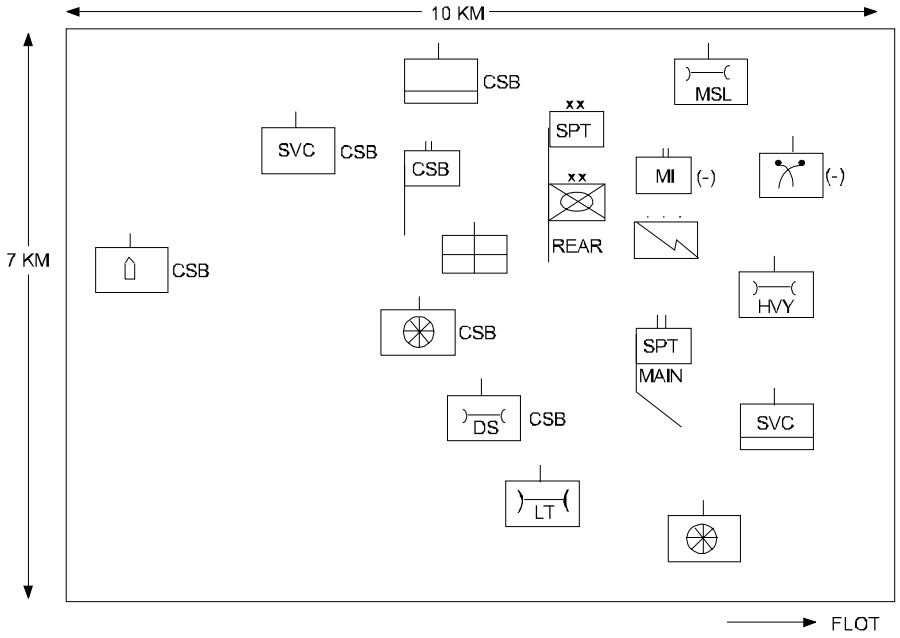

Figure III-6. Support Brigade

The Support Brigade includes the following units:

- Supply and Service Company
- Heavy Maintenance Company
- Light Maintenance Company
- Missile Maintenance Company
- Direct Support Maintenance Company
- Direct Support Supply Company
- Field Service Company

- Two Truck Companies
- Medical Company
- Direct Support Ammunition Company
- Chemical Defense, Signal, Intelligence, and Military Police Units of Platoon Size
- Four Headquarters Elements.
- Note that air defense assets are integrated with the units for point defense.

The Support Brigade has a personnel strength of 2,314 divided equally among those in the open, in tents, and in vans. There are seventy repair or shop vans in which personnel could be working. The deployment of the support brigade is assumed to be the same, whether offense or defense. Table K-6.1 describes the brigade, at the icon level of detail, in tactical arrangement; Table K-6.2 provides similar information for each icon, arranged by icon number. Figure K-6 provides a tactical layout of this scenario.

c. Light Infantry Brigade

The Light Infantry Brigade comprises three infantry battalions, an artillery battalion, and a support battalion, as shown in Figure III-7.

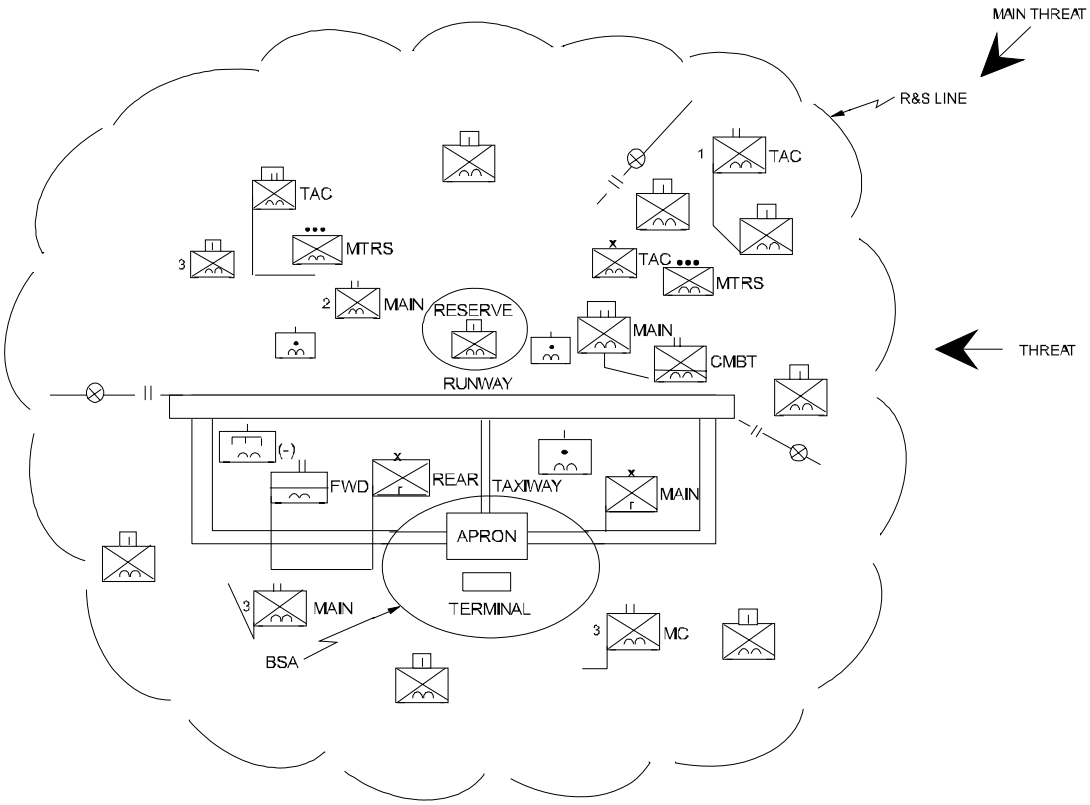

Figure III-7. Light (Airborne) Infantry Brigade Task Force

d. Amphibious Assault Force

The amphibious assault force consists of one Marine Expeditionary Force (MEF) with naval fire support, as shown in Figure III-8. It includes 30 amphibious ships, 18 surface combatants providing close cover and fire support for the amphibious assault, and 14 surface combatants providing an AAW/ASuW screen to the north of the main body of the force.

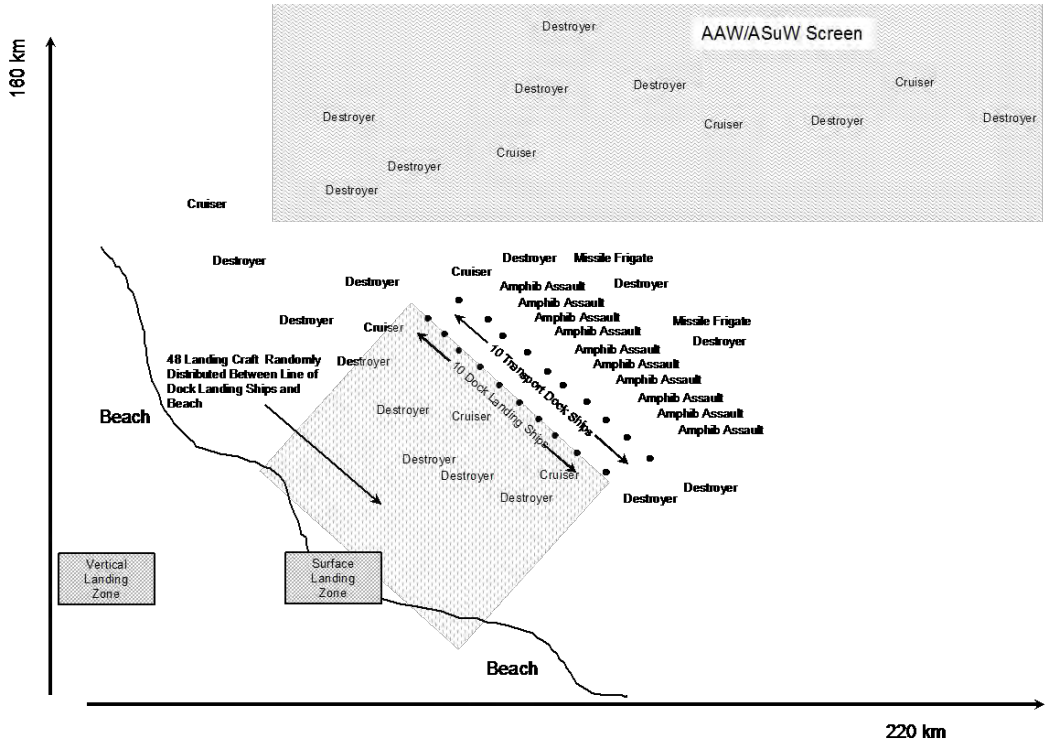

Figure III-8. Amphibious Assault Force

In this scenario Marine forces have established a surface landing zone on the beachhead and a vertical landing zone 50 kilometers to the west. This force has a strength of 69,668 personnel. The bulk of the force is concentrated in an area roughly 85 kilometers by 90 kilometers in size; the entire force covers an area 160 kilometers by 220 kilometers in size.

Appendix K, Table K-8.1, describes the brigade, at the icon level of detail, in tactical arrangement; Table K-8.2 provides a description of the unit with gridpoint coordinates. Figure K-8 provides a schematic of this scenario. The documentation process revealed discrepancies between the scenario description in AMedP-8 Biological and the troop data used for casualty estimation and described in Appendix K; the number

of ships and personnel appear to be inconsistent between the two sources. Appendix P discusses the sources and possible reasons for the apparent discrepancies.

e. Naval Task Force

The naval task force consists of three carrier battle groups, with escort and fire support ships. It is organized as shown in Figure III-9 to establish sea control and project power ashore from the littoral. The task force is comprised of three aircraft carriers, eight cruisers, and 14 destroyers. It has a strength of 25,274 personnel and covers an area roughly 115 kilometers by 140 kilometers in size. Appendix K, Table K-9, describes the task force by ship, providing the ship class, type, coordinates, and number of personnel for each ship. Figure K-9 provides a high-resolution schematic of this scenario.

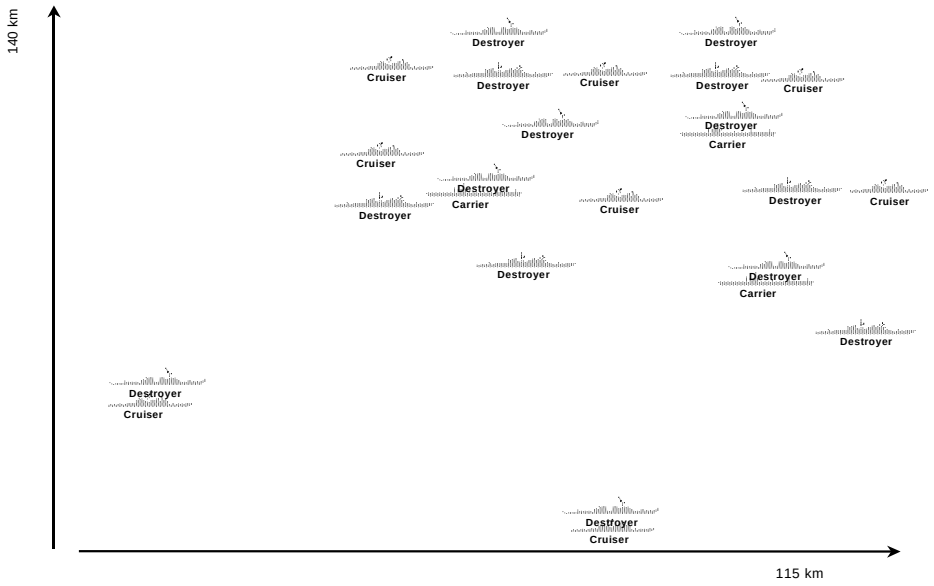

Figure III-9. Naval Task Force

f. Air Port of Disembarkation (APOD)

The notional APOD complex consists of an airfield supporting air command operations, in addition to serving as a port of disembarkation. The area also hosts a number of other military organizations that represent a sizable population. Units cover an area of 8 kilometers by 6 kilometers in size, as shown in Figure III-10.

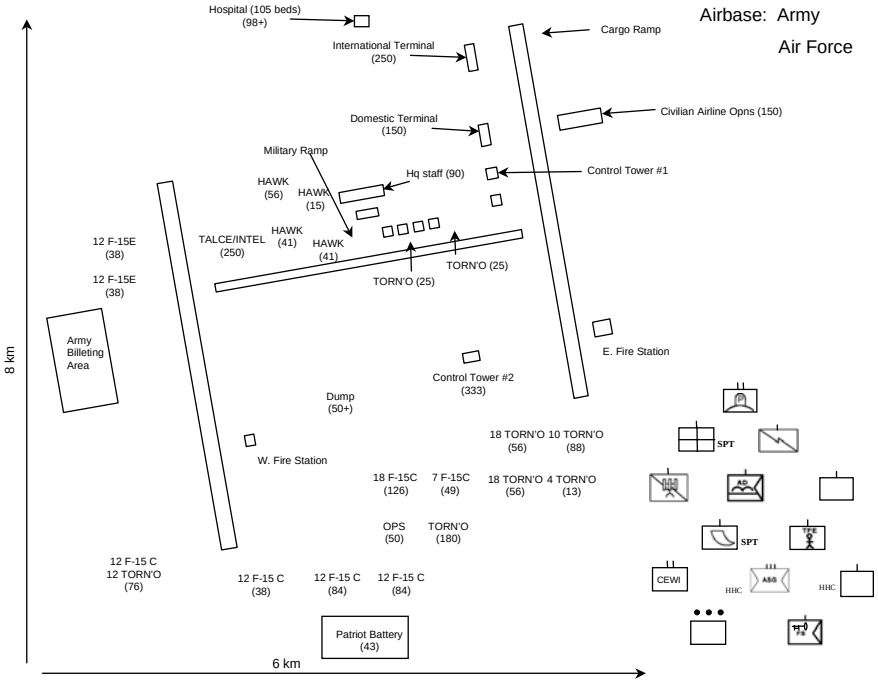

Figure III-10. Air Port of Disembarkation (APOD)

In this scenario, Air Forces and Special Operations Forces have been deployed to the APOD area. In addition, several key headquarters facilities are located here. Total strength of all military units at this location is 3,593 military personnel. Appendix K, Table K-10, describes the scenario by providing the number and type of personnel at each gridpoint location. Figure K-10 provides a tactical layout of this scenario.

g. Sea Port of Disembarkation (SPOD)

The notional SPOD complex consists of a large port with an offloading and marshalling area, a helicopter offload and assembly facility, a container offload area, and a collocated railhead. In this scenario, an Army heavy division is offloading at the port facilty. Units cover an area of 7 kilometers by 3.5 kilometers in size, as shown in Figure III-11.

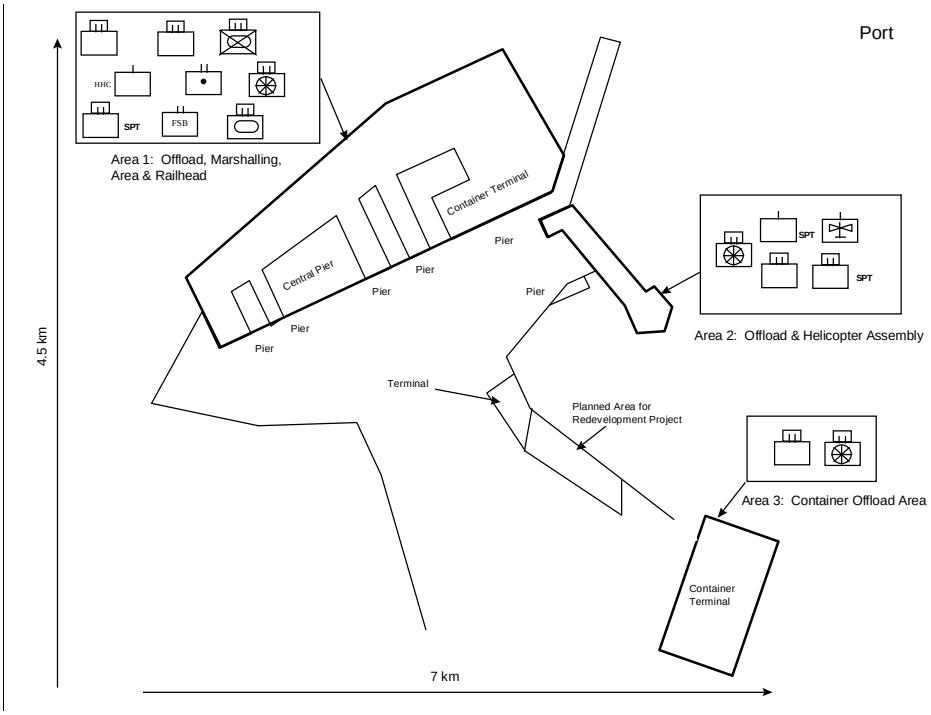

Figure III-11. Sea Port of Disembarkation (SPOD)

The Army heavy division equipment will be transported on seven ships; two ships will offload per day at the port facility. Personnel will arrive by air and will remain in the area for 6 days preparing for combat. The total strength of all units at this location is 12,500 military personnel. This does not include civilian workers or other collocated civilians. Appendix K, Table K-11.1, describes the brigade, at the icon level of detail, in tactical arrangement; Table K-11.2 describes the scenario by providing the number and type of personnel at each gridpoint location. Figure K-11 provides a schematic of this scenario.

B. INPUTS FOR BIOLOGICAL EXPOSURE ESTIMATION: AGENT CHARACTERISTICS

The diseases caused by the biological agents of interest are described in Section 3 of AMedP-8 Biological.[2] AMedP-8 Biological contains background information on agents including signs and symptoms, incubation periods, and fatality rates. In addition to general agent background information, specific agent characteristics are required in order to calculate agent exposure using VLSTRACK.

VLSTRACK uses the following biological agent characteristics: bulk density (g/cm^3), sprayer dissemination efficiency (%), median lethal or effective dose (μg), Probit slope (base 10), particle mass median diameter (microns), geometric droplet/particle distribution sigma, daytime bio decay rate (%/min), nighttime bio decay rate (%/min), bio agent purity (%), and exploding munitions dissemination efficiency (%). Table III-1 defines the agent characteristics used by VLSTRACK.

Table III-1. VLSTRACK Agent Characteristics

Characteristic	Definition*
Bulk Density (g/cm^3)	The density of an agent in its filled form. For dry form biological agents, this is the density of the powder or solid cake; for wet form biological agents, this is the density of the slurry.
Dissemination Efficiency (%)	The percentage of agent fill that is effectively disseminated as respirable, viable organisms or active toxins by a sprayer.
Median Effective Dose (μg)	Typically referred to as ED_{50}; the dose required to cause effects in 50% of the population exposed to that dose.
Probit Slope	Expressed in base-10, the slope of the curve used to represent human response to doses of harmful substances; in this case, the y-axis is the administered dose, and the x-axis is the probability of response.
Particle Mass Median Diameter (microns)	The particle size at which 50% of the mass of aerosolized agent is contained in smaller particles and 50% of the mass of aerosolized agent is contained in larger particles.
Exploding Munitions Dissemination Efficiency (%)	The percentage of agent fill that is effectively disseminated as respirable, viable organisms or active toxins by an explosive munition.
Daytime Bio Decay Rate (%/min)	The rate at which organisms are killed or toxins inactivated in direct sunlight.
Nighttime Bio Decay Rate (%/min)	The rate at which organisms are killed or toxins inactivated in the absence of sunlight.
Bio Agent Purity (%)	The percent of bulk material mass which is comprised of initially viable organisms or active toxins.
Particle Distribution Sigma	The standard deviation for a log-normal size distribution of particles for a given agent in aerosolized form.

* The definitions provided here are taken from Bauer and Gibbs, 1995, pp. 3-76 to 3-78.

[2] STANAG 2476 NBC/MED, AMedP-8(B).

C. INPUTS FOR BIOLOGICAL EXPOSURE ESTIMATION: MUNITIONS AND DELIVERY SYSTEMS

1. Munitions and Delivery Systems Summary

As described in Section II, several delivery systems were modeled in AMedP-8 Biological, each with three different attack intensities—light, moderate, and heavy. Table III-2 lists these delivery systems and portrays the difference between attack intensities for each delivery system.

Table III-2. Delivery Systems and Intensities Modeled in AMedP-8 Biological

Delivery System	Light	Moderate	Heavy
10 km Ground Line Source	10 kg	50 kg	100 kg
100 km Ground Line Source	100 kg	500 kg	1000 kg
10 km Aerial Line Source	10 kg	50 kg	100 kg
100 km Aerial Line Source	100 kg	500 kg	1000 kg
122 mm MRLS	240 rockets	480 rockets	720 rockets
500 kg Bombs	2	6	12
Medium Range Missiles	1	3	5
Medium Range Missiles (Bio Sub)	1	3	5
Man-portable Sprayer	2.4 kg	4.2 kg	7.2 kg
Human Vectors	1 individual	3 or 5 individuals	5 or 25 individuals

2. Munitions and Delivery System Characteristics

Munitions and delivery systems must be characterized in order to model agent dissemination and determine resulting agent exposure. VLSTRACK uses the following delivery system and munitions characteristics: fill weight, height of burst, firing rate, number of delivery systems in attack, downrange and cross-range target standard deviations, particle mass-median diameter, particle distribution sigma, line source length, line source fall angle, and cloud sigma. Table III-3, below, defines some of these characteristics.

Table III-3. Delivery System and Munitions Characteristics

Characteristic	Definition*
Fill Weight (kg)	The weight of the agent fill contained in the munitions, at 1.0 g/cm^3. For given agent, fill weight is multiplied by bulk density to determine the actual weight of agent used.
Height of Burst (m)	The altitude at which a munition explodes or otherwise releases agent.
Firing Rate (rounds/min)	For munitions typically delivered in volleys, such as artillery shells, the rate at which they are fired at their target.
Downrange and Crossrange Target Standard Deviations (m)	These values represent the accuracy of detonation coordinates relative to the target.
Line Source Length (m)	The length of the line along which the payload of a large delivery system (such as missile) is released, if release occurs above ground at high velocity, and if the munition is appropriately fuzed.
Line Source Fall Angle (degrees)	The angle between the horizontal and the line along which agent is released.
Cloud Sigma	Values used to represent the trivariate Gaussian distribution of mass away from the detonation point. For single point releases, these values are defined for both vertical and horizontal spread. For line sources, a single value is used to represent the radial distribution away from the axis of the line source.

* The definitions provided here are taken from Bauer and Gibbs, 1995, pp. 3-76 to 3-78.

VLSTRACK allows users to input *x* and *y* coordinates for the impact locations of individual munitions, in lieu of using the target standard deviations defined in the munition parameter file to calculate these coordinates. In the development of AMedP-8, the first time any munition and attack intensity combination was considered, these coordinates were calculated by the model. In all subsequent cases, the *x* and *y* coordinates calculated by the model in the first case were used as inputs.

D. INPUTS FOR BIOLOGICAL EXPOSURE ESTIMATION: METEOROLOGY CHARACTERISTICS

As shown in earlier in Figure III-1, meteorological data is one of the inputs into VLSTRACK. Inputs include data for wind direction, wind speed, air temperature, degree of cloud cover, and Pasquill stability category. Table III-4 defines these meteorological characteristics.

Table III-4. VLSTRACK Meteorology Characteristics

Characteristic	Definitions*
Wind Direction	In degrees true North (DTN), where 0 DTN is to the North (from the South), 90 DTN is to the East (from the West), 180 DTN is to the South (from the North), and 270 DTN is to the West (from the east).
Wind Speed (km/hr)	The speed of the wind, in kilometers per hour, at a user-defined wind measurement height.
Air Temperature (^{O}C)	The temperature in degrees C of ambient air; a negative air temperature is subtracted from 50 to result in a number from 51 to 99.
Degree of Cloud Cover	In VLSTRACK, this is represented by selecting from “clear,” “partly cloudy,” and “overcast.”
Pasquill Stability Category	This is a characterization of atmospheric stability and ranges from very stable (category 7) to very unstable (category 1). If the user sets the stability category to 0, the program will calculate atmospheric stability from other meteorological inputs, time of day, and location on the globe.

* The definitions provided here are taken from Bauer and Gibbs, 1995.

IV. CALCULATIONS FOR BIOLOGICAL EXPOSURE ESTIMATION

A. SELECTION OF METEOROLOGICAL CONDITIONS

AMedP-8 generally considers "worst case" meteorological conditions, consistent with the overall objective of estimating the greatest possible load on the medical system resulting from NBC attacks. For the biological volume, consideration of "worst case" conditions was particularly critical, because the degree of threat posed by a biological agent attack can vary by orders of magnitude depending on the meteorological conditions prevailing at the time of attack and in the hours immediately thereafter.

"Worst case" meteorological conditions are defined as those under which agent dissemination has the greatest potential for causing illness. These may or may not be those that spread agent across the largest geographic area; in many cases, smaller clouds with higher concentrations of agent can cause more people to become ill than larger, more diffuse clouds. As described below, the criteria used to select meteorological conditions consider both the size of the area affected and the concentration of agent within that area.

The "worst case" meteorological conditions used to develop AMedP-8 are also scenario-independent. One of the objectives of AMedP-8 is to allow planners to evaluate the effects of a given threat on forces in various tactical configurations. For this reason, the evaluation of meteorological conditions did not consider the tactical scenarios per se, but rather assumed an evenly distributed population.

1. Input Data Sources

The AMedP-8 Biological meteorological evaluation used an existing database of meteorological conditions developed by STI Corporation (STI) for analysis with VLSTRACK. STI collected data on temperature, wind speed, wind direction and cloud cover at one-hour intervals over a one-year time span at five locations worldwide. The data collection year ran from June 1, 1996 through May 31, 1997. The collection locations were Ankara, Turkey; Trappani, Italy; Tel Aviv, Israel; Riyadh, Saudi Arabia; and Osan, South Korea. The data collection interval of one hour was driven by the meteorological data requirements of the then-current version of the VLSTRACK model.

The database used in the development of AMedP-8 had been analytically reduced by STI, so that it included 21 sets of 24-hour data from each location, or 105 sets in total. STI accomplished this reduction by first using VLSTRACK to model a release of agent under each set of meteorological conditions, then calculating the size of the area that would contain a minimum cumulative particle concentration of 0.1e-04 particles/m^3. For each location, STI then ranked-ordered each data set by its associated area coverage, as calculated in VLSTRACK. Finally, STI selected a subset of 21 data sets for each location, corresponding to 5 percentile increments in the rank ordering, including the minimum and maximum.

In its VLSTRACK calculations, STI varied only the meteorological conditions; all other VLSTRACK inputs were held constant. As shown in Table IV-1, these constant inputs included both agent and delivery system.

Table IV-1. VLSTRACK Inputs Used by STI to Rank Meteorological Conditions

Input	Definition
Munition	1 long-range missile with 500 submunitions
Agent	Bio Agent 1b (VLSTRACK default parameters)
Height of burst	1 meter
Detonation coordinates	Gaussian
Surface type	Barren
Wind measurement height	1 meter
Wind direction sensitivity	0 degrees
Met condition duration	1 hour
Grid points	101 downwind by 101 crosswind
Biological decay	2.0%/minute daytime, 0.2%/minute nighttime

The STI summary of data selected for Ankara is provided in Table IV-2 as an example. In this summary, the first column provides the percentile increment, the second column provides the date the data set was collected, the third column provides the modeled time of agent release (in Zulu time), and the fourth column provides the area, in millions of hectares, with a minimum cumulative particle concentration of 0.1e-04 particles/m^3.

Table IV-2. Ankara Meteorological Data Evaluated for AMedP-8

Data Rank	Date of Collection	Modeled Time of Release (Zulu hours)	Area with Cumulative Particle Concentration < 0.1e-4 particles/m^3 (millions of hectares)
Minimum	26 June 1996	1800	.044592
5th percentile	22 November 1996	1800	.079585
10th percentile	08 June 1996	1800	.089409
15th percentile	12 June 1996	1800	.100801
20th percentile	03 June 1996	1800	.110017
25th percentile	18 January 1997	1800	.120705
30th percentile	12 November 1996	1800	.133633
35th percentile	15 October 1996	1800	.142977
40th percentile	23 February 1997	1800	.153409
45th percentile	19 September 1996	1800	.173569
Median	01 October 1996	1800	.193921
55th percentile	12 February 1997	1800	.214529
60th percentile	25 November 1996	1800	.240642
65th percentile	15 January 1997	1800	.274264
70th percentile	14 August 1996	1800	.307330
75th percentile	09 August 1996	1800	.351106
80th percentile	08 January 1997	1800	398850
85th percentile	13 August 1996	1800	.454659
90th percentile	30 September 1996	1800	.541306
95th percentile	08 April 1997	1800	.663044
Maximum	27 November 1996	1800	1.189894

The criteria used by STI to rank meteorological conditions—the area containing a minimum cumulative particle concentration—is not necessarily the same as that selected for the AMedP-8 meteorological assessment—the conditions with the greatest potential for causing illness. As noted, larger clouds may be more diffuse and cause less incidence of illness among a given target population than smaller clouds with higher concentrations of agent. Thus it was not necessarily the case that the set of meteorological conditions assessed by STI to be "worst case" should be the one chosen for AMedP-8.

To test this, a series of VLSTRACK clouds was generated using the STI data, and with the AMedP-8 agent and delivery system data most closely resembling that used by STI in its analysis—the medium range missile with submunitions containing the

VLSTRACK default input data for Bio Agent 1b. Using the IDA BioStrike model, these clouds were then overlaid on a target grid of 200 km by 200 km, with 1 km spacing and with one person at every grid point. BioStrike calculated the total number of expected casualties that resulted among the modeled population, given the concentration of agent at each grid point and using a Probit model of human response. Since this "casualty value" depends both on the size of the cloud (the number of people exposed) and the concentration within the cloud (the amount of agent any given person is exposed to), it is a better measure of a cloud's potential to cause illness than an area coverage measure alone.

All 105 meteorological data sets were ranked according to their BioStrike casualty value, and this ranking was then compared with the area ranking provided by STI. The results of this comparison are shown in Figure IV-1, where the x-axis label is an identifier assigned to each set of meteorological data (location and date) and the y-axis values are the associated casualty value and area rankings. As shown, the two ranking systems correlate fairly well overall, but vary significantly at important points. For example, the overall "worst case" conditions in terms of area coverage occurred in Trappani on November 27, but these conditions were ranked 87th in terms of casualty value. Alternately, the "worst case" conditions for casualty value occurred in Trappani on April 4; these were ranked 12th for area coverage.

This test demonstrated that the criteria used to evaluate meteorological conditions for AMedP-8 could lead to different results than those used by STI, and that the STI results should not adopted wholesale for use in AMedP-8.

At the same time, the two approaches provide generally consistent results. Figure IV-2 plots the casualty value and the area coverage value for all 105 sets of meteorological data. As shown, the slope of the resulting line is actually slightly steeper for the casualty value, meaning there is even greater variability in the data when evaluated using this measure than there is with the area coverage measure. This suggested that the data set provided by STI was representative of the range of possible meteorological effects, and reasonably could be used in the development of AMedP-8.

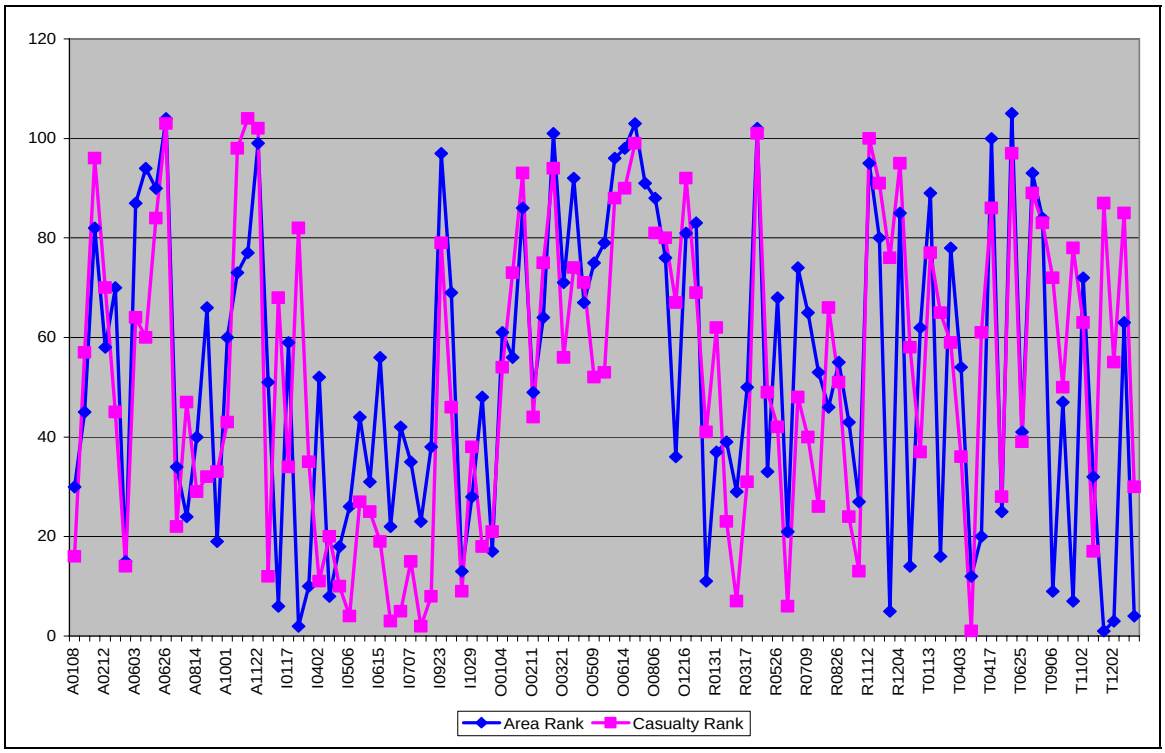

Figure IV-1. Comparison of Meteorological Condition Rankings by Different Criteria

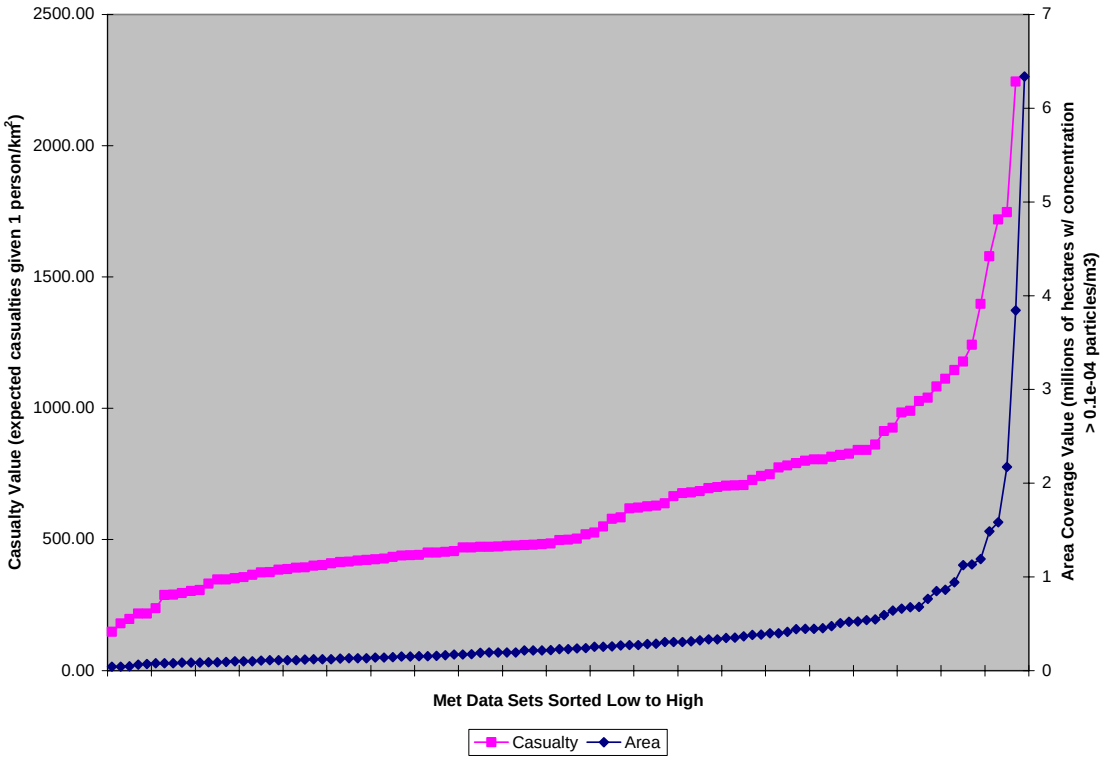

Figure IV-2. Casualty and Area Coverage Values for STI Data Set

2. Approach

The tests of the STI data sets demonstrated that when selecting "worst case" meteorological conditions, different measures of effectiveness would lead to different results. As defined in AMedP-8 generally, the "worst case" is that which produces the greatest load on the medical system; for the biological volume, this was specifically that which caused the largest number of people to become ill. Therefore when evaluating meteorological conditions, the objective was to select those that had the greatest potential for producing illness, integrating both the size of the resulting cloud and the concentration of agent within it.

For AMedP-8, the STI data set—developed from a single combination of agent and delivery system—had to be extended to ten agents and nine delivery systems. This process began with the decision to select a common set of meteorological data for each agent, versus each agent/delivery system combination. Tests that varied agents and delivery systems showed that the initial conditions associated with agent characteristics, such as ED_{50}, bulk concentration and decay rate, had a greater impact on casualty values than those associated with delivery systems, such as the altitude of release, the beaten zone area, or even the amount of agent released.

A typical example of this is presented in Table IV-3 for one set of meteorological data—that collected in Ankara on October 1, 1996.[1] Clouds were generated for each agent and for seven of the nine delivery systems considered in AMedP-8; to avoid skewing results, only one of the two aerial sprayers and one of the two ground sprayers were modeled. As with the first tests of meteorological data, these clouds were then overlaid on a target grid of 200 km by 200 km, with 1 km spacing and with one person at every grid point. The BioStrike model was used to calculate the casualty values for each agent/delivery system combination.

As shown in Table IV-3, deviation in results was typically greater—in some cases much greater—among agents with a common delivery system than among delivery systems with a common agent. In other words, there was more consistency among delivery systems, for a given agent, than there was among agents, for a given delivery system.

At the same time, the overall objectives of AMedP-8 argued for some level of generalization among inputs, so that users of the document could compare the effects of

[1] This data set was the 50th percentile set for Ankara, as evaluated by STI using its area coverage measure.

various munitions and differences in tactical configuration on the resulting casualties. Thus "worst case" meteorological conditions were selected for each agent among those that were most effective across all delivery system types.

Table IV-3. Effect of Agent and Delivery System Variation on Casualty Values

	Aerial Sprayer	Ground Sprayer	Manportable Sprayer	Rockets	Bombs	Missile w/ Submunitions	Medium Range Missile	Standard Deviation
Anthrax	1017	1174	626	577	500	626	972	244
Botulinum Toxin	5	407	26	223	72	132	224	131
Tularemia	1429	1585	978	969	761	1108	1529	296
Plague	1	81	8	40	38	68	36	27
SEB	220	982	332	467	372	530	911	271
Q Fever	479	795	326	381	319	377	525	155
VEE	860	946	468	533	490	608	942	200
Smallpox	76	837	286	315	202	241	296	223
Brucellosis	289	654	128	443	388	512	778	202
Glanders	209	421	79	341	304	369	433	117
Standard Deviation	461	406	288	233	203	283	423	

The approach used to select meteorological input data for AMedP-8 was basically the same one used to test the STI data sets and to support the decision to optimize meteorology by agent. For each agent, VLSTRACK clouds were generated for all 105 sets of meteorological data, using the moderate intensity attacks for seven of the nine delivery systems. Based on experience and general observations, the developers believed that light and heavy attacks would provide redundant results and did not consider them separately. To avoid skewing results, only one of the two aerial sprayers and one of the two ground sprayers considered in AMedP-8 were modeled, as with earlier tests. Each of these clouds—a total of 735 for each agent—was overlaid on a target grid of 200 km by 200 km, with 1 km spacing and with one person at every grid point. The BioStrike model was then used to calculate the casualty values for each case.

Next, the sets of meteorological data were ranked for each delivery system, based on their associated casualty value. The results were compared across the seven delivery systems to determine which set consistently produced the highest casualty values.

An example of this process is shown in Tables IV-4 and IV-5 for the agent tularemia; calculated casualty values and associated values for all agents are provided in Appendix K. Table IV-4 shows the casualty values output from BioStrike; Table IV-5 shows the ranking of each meteorological data set for each delivery system. Note that for

each delivery system, there are up to three instances where the cell has been left blank. Rarely, VLSTRACK would not produce output with a given combination of meteorological data and the standard set of input values associated with a given delivery system. Rather than change the input values—and the results—these data sets were removed from consideration for that agent.

Each meteorological data set was ranked from 1 to 105 for each delivery system, with 1 having the smallest casualty value and 105 having the largest. In cases where one or more data sets had to be discarded, the largest rank was reduced. For example, for the aerial sprayer, the largest rank for any meteorological data set is 103.

The set of meteorological data selected for each agent was that which ranked consistently highest for all delivery systems. A maxi-min strategy was used to determine this: the data set chosen was that with the maximum rank that was the minimum for the seven delivery system. For tularemia, for example, this was the I0506 (Israel, May 6, 1997) data set, highlights in Table IV-5. This was the only data set where all seven delivery systems had a ranking of 96 or higher.

Consideration was given to the alternate approach of summing the ranks for the seven delivery systems, then selecting the data set with the highest total number. In the case of tularemia, and for most of the agents considered, this would have led to the same result. There were three agents, however—botulinum toxin, SEB and Q fever—where a different set of meteorological data would have been selected if this alternate approach had been used. Typically, though, despite the overall higher number, one of the delivery systems would have a very low rank. Because consistency was a consideration in the selection of meteorological data, and because the differences in total number were slight, the maxi-min approach was used.

For plague and smallpox, there was no single set of meteorological data that resulted in all seven delivery systems being ranked in the top 50%. In these two cases, the max-min strategy was used to find the highest minimum rank associated with six delivery systems, and the ranking of the seventh delivery system was used as a tiebreaker.

Table IV-4. Casualty Values for Tularemia, Moderate Intensity Attacks, All Meteorological Conditions (page 1 of 2)

Met Data	Aerial Sprayer	Ground Sprayer	Manportable Sprayer	Rockets	Bombs	Missile w/ Submunitions	Medium Range Missile

For glanders, no set of meteorological data consistently produced rankings in the top 25% for all delivery systems. In this case, there were two equally viable candidate sets of data. One had six delivery systems with minimum ranks above 92, and the seventh delivery system had a rank of 25. The other had six delivery systems with a minimum rank of 90, and the seventh delivery system had a rank of 60. Because the

max-min values were so close, and because the rank of the seventh delivery system was so much higher, the second set of data was selected.[2]

In all three of these cases, the meteorological data set selected also would have been chosen had the alternative selection approach been used, as the sum of their collective rankings was highest among all the data sets.

3. Results

The meteorological data sets selected for use in AMedP-8 are shown in Table IV-6; the data themselves are provided in Table IV-7.

Table IV-6. Summary of Meteorological Data Selected for AMedP-8

Agent	Selected Data Set	Minimum Rank*
Anthrax	I0506	98
Botulinum Toxin	O0211	87
Tularemia	I0506	96
Plague	T0316	75 (12)
SEB	I0509	74
Q Fever	A0108	92
VEE	R1125	100
Smallpox	I0626	99 (39)
Brucellosis	A0408	91
Glanders	I0409	90 (60)

* Note that for the agents plague, smallpox and glanders these are the minimum ranks among six of seven delivery systems, as described in the text below. The rank of the seventh delivery system is given in parentheses for these agents.

The meteorological data inputs to VLSTRACK associated with the selected data sets are shown in Table IV-7. Each cell contains 12 numbers which collectively describe meteorological conditions for a specific hour. The first three numbers refer to wind bearing, in degrees true north. The second three numbers are wind speed, in kilometers per hour. The next number represents a measure of atmospheric stability, using Pasquill Stability Categories. In this scheme, a value of 1 represents very unstable conditions, a value of 4 represents neutral conditions, a value of 7 represents very stable conditions, and intermediate values represent intermediate conditions. A value of 0 means the stability category is unknown, and a value will be calculated by the program using other meteorological data inputs. The next two numbers are air temperature, in degrees Celsius. If the air temperature is negative, it is subtracted from 50 to result in a number

[2] Data comparable to that shown in Tables IV-3 and IV-4 are provided for all agents in Appendix L.

from 51 to 99. The next two numbers are placeholders for relative humidity, and are not used in this version of VLSTRACK. The last number represents cloud cover, where 0 refers to clear skies, 1 to partly cloudy skies, and 2 to overcast skies. Here, VLSTRACK does not account for humidity.

B. BIOLOGICAL AGENT CLOUDS

The biological agent clouds used in the AMedP-8 methodology are approximations of the downwind agent hazard resulting from a release of biological agent, expressed in planar dimensions over time. As noted in Section II.B, the VLSTRACK model, version 1.6.1, was used to generate biological agent clouds for AMedP-8.[3] Separate clouds were created for each combination of agent, delivery system, and attack intensity.

Concentration of agent in aerosolized form is reported as a two-dimensional grid for each of a series of time steps. For AMedP-8 Biological, the grid has 201 points on each side, the maximum allowed by VLSTRACK. In addition, AMedP-8 agent clouds have self-adjusting grid sizes, meaning the grid size changes over time to encompass the hazard as it grows after release and then shrinks as it dissipates.

As noted, the use of the BioStrike model requires agent cloud data reported in a specific format; to streamline the methodology, IDA developed a version of VLSTRACK, called Gridgen, to report the outputs of VLSTRACK in a BioStrike-compatible format. The Gridgen model also manages time steps slightly differently than VLSTRACK. VLSTRACK Version 1.6.1 allows users to specify meteorological data for up to 24 time periods of uniform duration, which may be as short as 1 minute or as long as 1 hour. It will report up to 60 outputs per time period, but the minimum reporting interval is 1 minute. As with time periods, reporting intervals are of uniform duration. The Gridgen model, on the other hand, allows users to specify non-uniform time steps, illustrated by the scheme shown in Figure IV-3.

In this case, Gridgen uses 12 data time periods. The first and second are comprised of 10 time steps of 3-minute duration; the third, 12 time steps of 5-minute duration, and so on. The initial advantage of this scheme over the default approach used

---

[3] The VLSTRACK model is capable of providing three types of output: dosage, deposition, and vapor/droplet/particle concentration. Dosage output provides estimates in terms of mg-min/m^3. Deposition output provides estimates in terms of mg/m^2 on the ground. Concentration output is in terms of part/m^3 of airborne droplets or particles. Only dosage outputs were considered in developing AMedP-8 Biological. VLSTRACK can provide output in four dimensions—three spatial dimensions and time. In the variant of VLSTRACK used to develop AMedP-8, the vertical dimension was restricted to a single point, with output provided for *x* and *y* locations on a plane intersecting the vertical dimension. For AMedP-8 Biological, this output was calculated at an approximate breathing height of 2 meters.

by VLSTRACK was that it allowed users to conserve computational time.[4] Users could choose short, high-resolution, but computationally intense time steps at those points in the cloud evolution at which the biological hazard is changing most rapidly—typically in the immediate aftermath of release—and switch to longer, lower-resolution time steps at other times where the hazard is changing more slowly.

Figure IV-3. Extract from GRIDGEN Special Inputs File Used For AMedP-8 Biological

The Gridgen adaptation of VLSTRACK allows users to input meteorological data by reporting time step, the duration of which is defined by the user in the special inputs file, as shown above. Because the meteorological data used to develop AMedP-8 Biological was collected hourly, it had to be adapted to the reporting interval scheme shown in Figure IV-3. This was done very simply by mapping the hourly meteorological data to the appropriate time steps; since no time steps overlapped hourly demarcations, the mapping was straightforward and no meteorological data had to be altered in the process.

C. DETERMINATION OF ATTACK LOCATIONS

The BioStrike model can be run in several modes, two of which were used extensively in the development of AMedP-8 Biological. In Maximization mode, BioStrike will examine all possible attack points on a rectangular grid within a user-defined search area and output the point or set of points resulting in the largest number of expected casualties. This attack location can then be used as an input to BioStrike's Evaluation mode, which will output the total number of expected illnesses and the amount of agent exposure at each troop location.

BioStrike typically defines "optimal" attack locations as those producing the largest total number of illnesses expected from an attack with a given agent cloud against

[4] At the time the AMedP-8 Biological was developed, computational speed was such that a single VLSTRACK run frequently took several hours to complete. At present, the same run would take at most a minute or two.

a given tactical formation. Expected illnesses are calculated using a Probit response model, where a given level of exposure is associated with a given probability of effect; the greater the exposure, the more likely it is to cause illness.

A Probit response curve is generally represented in BioStrike as a series of exposure values with an associated probability of illness. The variables used are FILLAX, which defines exposure values, and FILLAY, which defines the illness probability associated with each value of FILLAX. A typical set of FILLAX and FILLAY values for a notional biological agent, with an ED_{50} of 5.00e-2 μg and a Probit slope of 2 would be:

'FILLAX(1,.)'	0.	3.43e-3	7.53e-3	1.14e-2	1.53e-2	1.90e-2	2.30e-2	2.73e-2
	3.21e-2	3.74e-2	4.33e-2	5.00e-2	5.78e-2	6.69e-2	7.79e-2	9.14e-2
	1.09e-1	1.32e-1	1.65e-1	2.19e-1	3.32e-1	7.28e-1	7.28e+0	
'FILLAY(1,.)'	0.	.01	.05	.10	.15	.20	.25	.30
	.35	.40	.45	.50	.55	.60	.65	.70
	.75	.80	.85	.90	.95	.99	1.0*	

* Because AMedP-8 Biological considers very high levels of biological agent exposure, a probability of 1.00 was arbitrarily assigned to any exposure 10 times that of an ED_{99} value or greater.

Figure IV-4. Typical BioStrike Dose Response Inputs for a Notional Biological Agent

For any given calculated exposure, the probability of illness is calculated by linear interpolation. In the example above, an exposure of 5.00e-2 μg has a 50% probability of illness, while an exposure of 5.78e-2 μg has a 55% probability of lethality. If BioStrike estimated an exposure of 5.31e-2 μg, it would calculate an associated 52% probability of illness.

BioStrike is an expected value model, meaning that if an individual soldier in the modeled tactical unit has a 52% probability of illness, he is counted as 0.52 ill people. The individual probabilities of illness are summed for all members of the unit, to provide the total number of expected illnesses. This last value—total number of expected illnesses—is the one maximized in the BioStrike optimal attack location calculations.

In the development of AMedP-8 Biological, the BioStrike Maximization mode was used to determine the optimal attack location for each combination of agent, munitions, and attack intensity for each tactical scenario. An “optimal” attack location was defined in standard fashion as that which caused the highest number of expected

illnesses. Separate attack location calculations were performed for the protection available and protection unavailable cases.

When using BioStrike Maximization mode, the user must define a search area for which the model evaluates all possible attack locations along an *x,y* grid, with user-defined distances between grid points. The search area can be any polygonal shape, and the model can be directed to search either within or outside the boundaries of the polygon.

AMedP-8 Biological considers delivery systems used for both on-target attacks, such as artillery, bombs and missiles, and off-target attacks, such as aerial and ground sprayers. For on-target attacks, the search area for the AMedP-8 attack location calculations was defined as the area contained within the outer physical boundaries of the tactical unit; for off-target attacks, the search area was defined as any area outside the boundaries of the unit.

In this case, the model was directed to evaluate attack locations at 0.5 kilometer distances apart in both the *x* and *y* directions, except in the cases of the Amphibious Assault Force and Naval Task Force, where because of their very large size, attack locations were considered at 1 kilometer intervals. The search boxes defined for each tactical scenario and the associated optimal attack locations are shown in Figures IV-5 through IV-15. Each figure depicts the optimal attack locations for all combinations of agent, munitions, intensity, and protection calculated for the given tactical scenario.[5]

As shown in these figures, the optimal attack location can be quite different for any given combination of scenario inputs. The choice of agent in particular has a very great impact on the attack location calculations because each agent is associated with a different set of meteorological conditions, including initial and prevailing wind direction.

[5] Note that the two tactical Heavy Brigade Movement to Contact scenarios—Forward Maneuver and Brigade Support Area—have the same overall configuration and are differentiated solely by the location of the targeted area contained within the search box. In the first case, the forward maneuver battalions are targeted, and in the second, the support components of the brigade are targeted. In both cases, however, unit personnel within the brigade but outside the targeted area are considered in the calculation of illness.

D. CIVILIAN CASUALTY ESTIMATION

Both the air and sea ports of disembarkation are assumed to be located within a sizable urban area. Civilians living in the vicinity will be vulnerable to any biological agent attack against these facilities. For this reason, AMedP-8 Biological includes a rudimentary tool to estimate local civilian casualties resulting from modeled attacks in the APOD and SPOD tactical scenarios. This tool does not utilize the algorithms needed to characterize casualties based on their level of performance; rather, in this case "casualty" is defined simply as anyone who becomes ill.

All tactical scenarios in AMedP-8 are intended to be generic, and the civilian scenarios are as well. Because urban areas worldwide vary widely in size, shape, and distribution of populations, AMedP-8 makes the generic assumption that the population is distributed evenly in an annular or semiannular area surrounding the military port area. The urban area surrounding the APOD is characterized as a circle with a radius of 15 kilometers; the urban area surrounding the SPOD is characterized as a half-circle—on the assumption that it is adjacent to a large body of water—with a radius of 21 kilometers.

The overall size of the urban area is the same in both cases, and is approximately that of the 50 most populated cities in the world.[6]

Assuming an even population distribution will lead to an overestimation of casualties in some cases, or an underestimation in others, depending on the actual configuration of the urban area and the location of the attack. In the absence of specific information, however, assuming an even population distribution will provide planners with a basic understanding of the potential scope of the problem.

The population files were created using a BioStrike utility called TROOPC, which generates a circular array of a user-defined radius, with personnel evenly distributed along a user-defined number of spokes radiating from the center of the array, with a user-defined number of gridpoints per spoke. For the circular area surrounding the APOD, the array had a radius of 15 kilometers and contained 100 spokes with 40 points each. For the half-circle surrounding the SPOD, a circular array was created with a radius of 21 kilometers, and 200 spokes with 40 points each. The array was then divided in half, and all of the points from one half then removed, leaving an array in the shape of a half circle. Both of these arrays ultimately contained 4000 points and had an area of approximately 700 square kilometers. They were both also assigned a population of 8.646 million (the average of the 50 largest cities worldwide), divided evenly among the points so that each point had an assigned population of 2151.5.

Since civilians would not be living within the boundaries of the APOD or SPOD, the areas covered by these bases were removed from the urban arrays, reducing the area and the total number of points slightly. The resulting arrays are shown in Figures IV-16 and IV-17, below.

[6] At the time AMedP-8 Biological was developed, the most recent data on urban population was from 1996 and was produced by the United Nations Department of Economic and Social Affairs Population Division. The most recent data on urban area size was from 1991 and was from the Bureau of the Census, U.S. Department of Commerce. From these data, the 50 largest cities worldwide had an average population of 8.646 million and an average area of 440.3 square kilometers.

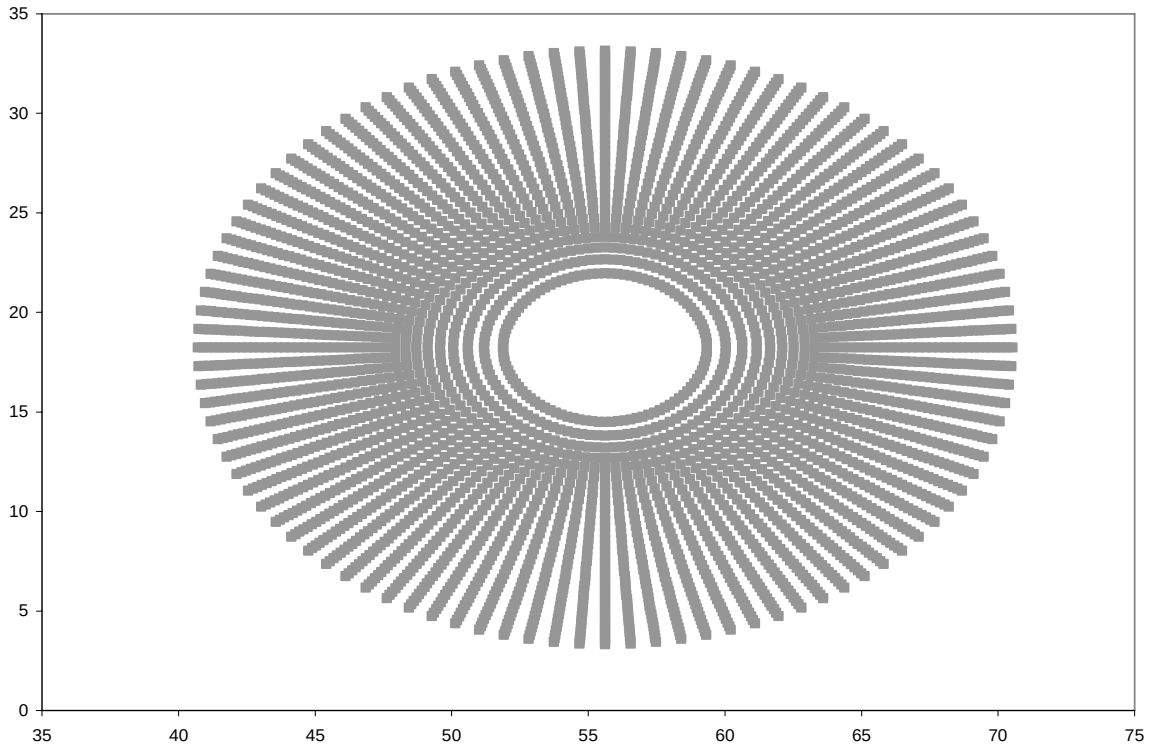

Figure IV-16. Civilian Population Array for Air Port of Disembarkation

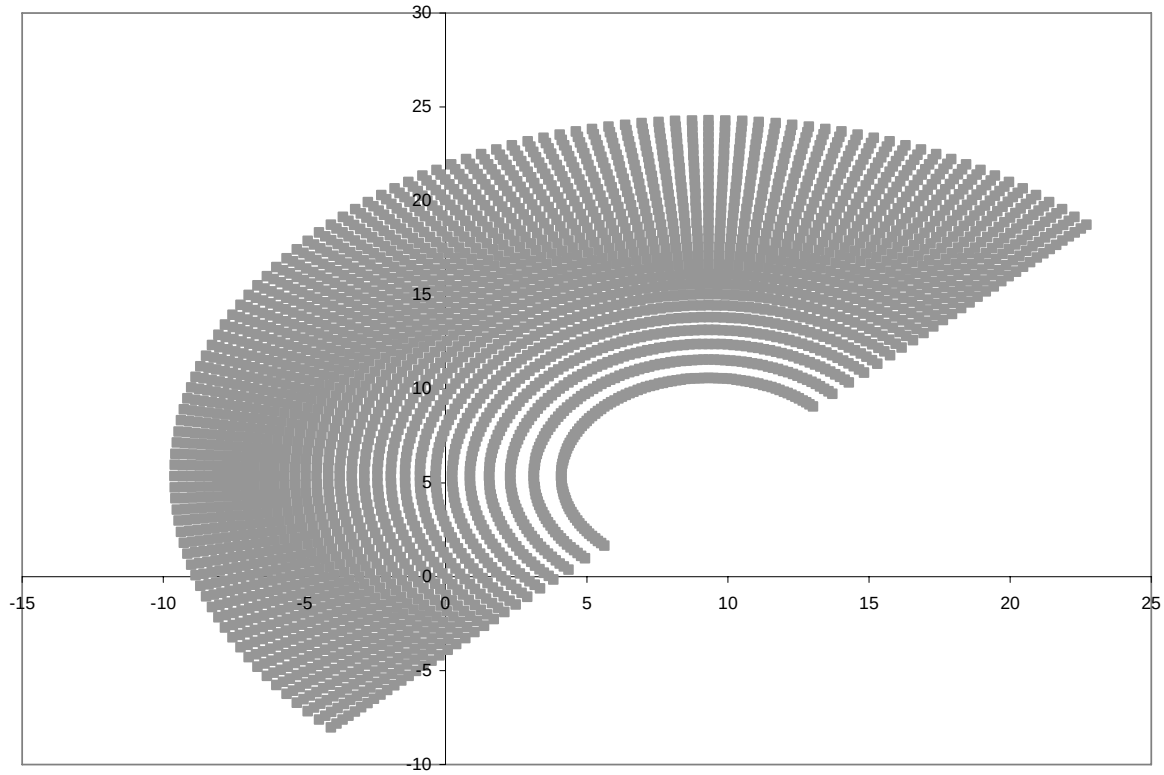

Figure IV-17. Civilian Population Array for Sea Port of Disembarkation

With the areas occupied by the military troop arrays removed, the resulting density of points and the total population in each array changed slightly. The APOD civilian array had a total population of 8,213,700, with each point representing an area of approximately 0.18 km^2. The SPOD civilian array had a total population of 8,295,837, with each point representing an area of approximately 0.21 km^2.

Once the civilian population arrays were developed, the BioStrike model was used to overlay modeled clouds for each combination of agent, delivery system, and attack intensity at the attack locations previously determined for the APOD and SPOD troop arrays. BioStrike then calculated the expected civilian casualties for an urban area of average population and size.

For the purposes of AMedP-8, though, these values were in and of themselves inadequate, as the objective was to provide planners with a means of calculating expected civilian casualties in specific geographic locations. To achieve this, the calculated casualties were revised to express the expected casualties per square kilometer, for areas of an equal size to those modeled. This value was then divided by the population density modeled in the civilian arrays, resulting in a set of multiplication factors that planners could use to roughly calculate expected casualties, given an area of equivalent size and knowledge of the average population density within that area.

An example of a *Multiplication Factors for Estimating Civilian Casualties* table is shown in Table IV-8. To use this table, the factors shown in the table are multiplied by the average population density, expressed as people per square kilometer, within the specified area:

*Expected casualties = average population density * multiplication factor (m)*

Table IV-8. Example AMedP-8 Civilian Casualties Multiplication Factors Table

Multiplication Factors (*m*) Sea Port of Disembarkation (radius = 21 km) Tularemia (expected civilian casualties = m * average population density)			
Delivery System	L	M	H
Point sprayer	355	349	345
1 km ground line source	386	344	345
10 km ground line source	344	335	332

E. MAGNITUDE OF CHALLENGE TABLES

The question of whether or not medical protection should be considered in AMedP-8 Biological was debated at length among its developers and those providing oversight within NATO. Arguments against doing so were both philosophical and practical: medical protection had not been considered in the nuclear and chemical volumes, and data on the effectiveness of specific countermeasures was too sparse to allow it. On the other hand, NATO and its member nations were relying heavily on medical protection as a defense against biological attack, and were in the process of developing policies and standardization agreements for its implementation. Planners needed to have some information on the benefits and potential limitations.

As a near-term solution, the document included Magnitude of Challenge tables at the beginning of each agent section. For each combination of agent, delivery system and attack intensity, these tables provide information about the size of the geographic area associated with various levels of challenge, defined in terms of multiples of ED_{50}s.[7] The tables are based on the assumption that some medical countermeasures might have reduced effectiveness given a sufficiently high dose. Planners in possession of the

[7] "Challenge" is purposely defined in these tables in a manner typically used to describe the effectiveness of medical countermeasures.

requisite data could use the tables to determine the extent to which various units in the vicinity of a biological attack would be affected, despite medical protection.

To develop the Magnitude of Challenge tables, the existing agent clouds modeled for each combination of agent, delivery system, and attack intensity were overlain on the center of a 200 km by 200 km grid, with points at 1 km intervals. The BioStrike model then calculated the cumulative concentration of agent that would be inhaled by an individual at each grid point, assuming a breathing rate of 15 liters per minute. This value was then divided by the value of the ED_{50} for the agent in question. The results were sorted for all grid points with a concentration greater than zero, and binned by order of magnitude as shown in the table template below.

Table IV-9 is a blank template for the Magnitude of Challenge tables included in AMedP-8 Biological. NATO determined that the information provided in these tables warranted a higher level of classification than that provided elsewhere in AMedP-8; to maintain ease of handling and distribution of this document, that information is not provided here.

F. OUTPUTS OF BIOLOGICAL EXPOSURE ESTIMATION

Appendices A through J each contain agent exposure estimates pertaining to one of the 10 agents considered in AMedP-8 Biological.[8] Each appendix provides the AMedP-8 exposure levels for all scenarios pertaining to one of the 10 agents:

- anthrax (Appendix A)
- botulinum neurotoxin (Appendix B)
- plague (Appendix C)
- tularemia (Appendix D)
- Staphylococcal enterotoxin B (SEB) (Appendix E)

[8] Note that the order of the appendixes reflects the order of agents presented in AMedP-8 Biological.

- Q fever (Appendix F)
- Venezuelan Equine Encephalitis (VEE) (Appendix G)
- smallpox (Appendix H)
- brucellosis (Appendix I)
- glanders (Appendix J)

In each appendix, Tables 1.1 through 1.*n* apply to the Forward Maneuver Battalion in Movement to Contact; the value of *n* varies depending on the number of delivery systems considered for the given agent. For some delivery systems, both protection available and protection unavailable cases are considered. Table 1.x.1 contains exposure estimates for the protection unavailable case, while Table 1.x.2 contains estimates for the protection available case. Similarly, for each appendix, Tables 2.1 through 2.*n* apply to the Brigade Support Area in Movement to Contact; Tables 3.1 through 3.*n* apply to the Forward Maneuver Battalion in Offense; Tables 4.1 through 4.*n* apply to the Forward Maneuver Battalion in Defense; Tables 5.1 through 5.*n* apply to the Brigade Support Area in Offense and Defense; Tables 6.1 through 6.*n* apply to the Support Brigade; Tables 7.1 through 7.*n* apply to the Light Infantry Brigade; Tables 8.1 through 8.*n* apply to the Amphibious Assault Force; Tables 9.1 through 9.*n* apply to the Naval Task Force; Tables 10.1 through 10.*n* apply to the APOD; and, Tables 11.1 through 11.*n* apply to the SPOD.

The following list summarizes the organization of the agent exposure estimate appendixes:

- Heavy Brigade, Forward Maneuver, Movement to Contact (Tables 1.1 through 1.*n*)
- Heavy Brigade, Brigade Support Area, Movement to Contact (Tables 2.1 through 2.*n*)
- Heavy Brigade, Forward Maneuver, Offense (Tables 3.1 through 3.*n*)
- Heavy Brigade, Forward Maneuver, Defense (Tables 4.1 through 4.*n*)
- Heavy Brigade, Brigade Support Area, Offense and Defense (Tables 5.1 through 5.*n*)
- Support Brigade (Tables 6.1 through 6.*n*)
- Light Infantry Brigade, Defense (Tables 7.1 through 7.*n*)
- Amphibious Assault Force (Tables 8.1 through 8.*n*)
- Naval Task Force (Tables 9.1 through 9.*n*)
- Air Port of Disembarkation (APOD) (Tables 10.1 through 10.*n*)
- Sea Port of Disembarkation (SPOD) (Tables 11.1 through 11.*n*)

Therefore, each appendix follows a similar organization scheme, but refers to a different agent. For example, the following organization applies to Appendix A, Anthrax.

V. ILLNESS/INJURY SEVERITY DETERMINATION

Sections III and IV described the methods IDA used to estimate individual agent exposure using VLSTRACK, Gridgen, and BioStrike. IDA then provided these values to Pacific-Sierra Research Corporation (PSR). In order to understand disease progression and the resulting severity of illness associated with exposure, PSR determined and mapped the severity of signs and symptoms (S/S) over time for each resultant disease of interest to AMedP-8 Biological. Using these maps and additional algorithms, they then estimated who of the exposed personnel were likely to become casualties based on initial agent exposure levels.

Using available clinical and experimental data, PSR developed two methodologies to estimate casualties from exposure levels. Depending on the agent, one of the two methodologies was then used to calculate casualties and generate injury severity estimates for each scenario. In the first methodology, using data collected from Military Research Volunteers (MRVs) who participated in vaccination efficacy studies during the 1950s and 1960s for illness resulting from tularemia, SEB and Q fever, S/S changes resulting from the anticipated progression of febrile illness over time were used to describe disease progression over time. Then, using performance-based algorithms similar to those used in AMedP-8 Nuclear and AMedP-8 Chemical, the S/Ss were used to estimate the effects of biological agent exposure on performance,[1] and casualty estimations were made depending on a pre-set performance level, as described in Section VII. For the remaining agents, the Knowledge Acquisition Management Instrument (KAMI) was used.[2] KAMI gathered information from subject matter experts (SMEs) about diseases resulting from biological agents for which only limited other human response data was available and was used to determine S/S severity profiles and likely times of illness, death and recovery. What follows is a very general description of how these S/S severity profiles were created in each of the two methodologies and what the

---

1 Anno *et al.*, 1998.

2 KAMI comprises a series of surveys, collecting information from SMEs who had experience with these agents from animal studies, accidental exposures, vaccine development, and other sources, in order to develop disease models, based on SME consensus, regarding agent infectivity, lethality, pathology, and times to onset and death or recovery. The first of KAMI surveys, distributed in 1998, covered anthrax, plague, botulism, and Venezuelan Equine Encephalitis. KAMI was revised in 1999 to achieve similar consensus about smallpox, brucellosis, and glanders. More detailed explanations of this model and its application to each agent are described in PSR's documentation of KAMI, Rickmeier et al., 1999 and McClellan et al., 2000.

resulting illness categories were determined to be. More detailed information on these methodologies is available in Anno et al., 1998, and McClellan et al., 2000.

A. DETERMINING SIGN/SYMPTOM SEVERITY PROFILES

1. Body Temperature Profiles – Tularemia, SEB, and Q Fever

For diseases resulting from some of the agents under consideration—tularemia, SEB, and Q Fever—limited, controlled human exposure data existed. Data had been collected in the clinical records of Military Research Volunteers (MRVs) during the 1950s and 1960s, when they participated in studies to determine the efficacy of vaccinations and antibiotics for preventing and treating biological agent exposure. Data also existed for these diseases from accidental and environmental exposures. For these three agents, the available data suggested that "body temperature provides a reliable indication of the degree of infection and the severity of febrile illness. It is utilized as the objective measure in this effort to quantify illness based on dosage…It also stands to reason that body temperature is in some manner proportional to the pathogen population and endotoxin level in the host."[3]

Although, in the case of all three agents and their resultant illnesses, additional S/S are present, PSR determined, based on the available data, that the severity of the S/S could be correlated to the febrile illness. MRVs had been subjected to both physical and cognitive tests over the course of their illnesses or intoxications. PSR used the data to determine their correlation between performance and increases in body temperature. Although many of the MRVs were treated with antibiotics after some period of illness, the data included by PSR referred only to the periods before antibiotic intervention. Additional data were collected from literature and research data for studies in which antibiotic intervention was not used to determine the S/S progressions in the later periods of infection.

PSR made several assumptions in its models, the most important of which is that febrile illness provides a useful single S/S of disease progression.[4] Using these assumptions, PSR developed algorithms to generate time- and dose-dependent temperature profiles, which demonstrated disease progressions, recovery, and fatality.

---

[3] McClellan, et al. 2000

[4] Additional assumptions for individual agents are included in McClellan et al., 2000 and Anno et al., 1998.

2. KAMI Data for Diseases Based on Natural and Accidental Exposures

The KAMI questionnaire was designed by Veridian Pacific-Sierra Research (Veridian PSR) to collect information on agents for which volunteer human experiments did not exist and only limited human response data existed. Most of the existing data was based on natural and accidental exposures. Upon request, SMEs completed the questionnaires and then met during two conferences in 1998 to reach consensus regarding agent and disease characteristics such as infectivity, pathology, times to onset and death or recovery, and illness severity, among other topics, for anthrax, plague, botulism, and VEE. Smallpox, brucellosis, and glanders information was collected using the same method by a similar panel a year later. Veridian PSR also collected data from relevant scientific literature.

For these agents, a range of S/S categories were used, depending on agent, including fever and associated malaise, fatigue and headache; cardiovascular; neurological; respiratory; skin; neuromuscular; circulatory; and musculoskeletal. For some agents, a single S/S was selected, however, for most agents, PSR selected four or more S/S. Using the selected S/S, PSR drew disease progression profiles or maps, which depicted symptom severity over time on a 0 – 4 or 5 scale, where 0 was no symptoms of illness and 4 or 5 represented most severe symptoms and/or fatality. For many agents, two disease progression maps were drawn—one representing fatal cases and the second representing nonfatal cases. It is important to note that the disease progression maps for the KAMI agents were built independent of dose.

B. CORRELATION OF EXPOSURE TO ILLNESS CATEGORIES

As in AMedP-8 Nuclear and Chemical, tables were created to correlate dose to resulting S/S. Similarly, the Illness (Severity) Category tables (shown below as they appeared in AMedP-8 Biological) provide a description of expected illness and injuries by exposure dose band. The S/Ss shown in the tables represent, in most cases, the most severe medical conditions exhibited for each dose band. The Illness Category number indicates the severity of illness resulting from the specified exposure on a scale of 1 – 4 or 5. These numbers, however, should not be confused with the S/S severity levels used in the disease progression profiles described above.

For tularemia, SEB, and Q fever, shown in extracted tables 3-12 through 3-14, dose-dependent fever ranges and symptoms are shown. For the KAMI agents, shown in extracted tables 3-9 through 3-11 and 3-15 through 3-18, this information was not

included. For some agents, the information was unavailable; for others, febrile illness is not an expected S/S.

The following Illness Category tables and accompanying text have been extracted from pages 3-14 through 3-20 of AMedP-8 Biological. To determine the Illness Category associated with each group of exposed personnel, the exposure value is entered into the appropriate table and used to select the Illness Category number.

1. Tables 3-9 through 3-11 show illness categories for anthrax (*Bacillus anthracis*), botulism (botulinum toxin), and pneumonic plague (*Yersinia pestis*) by agent exposure ranges, and associate them with an illness category number. Each category and range is followed by a typical description, which describes fever, onset time, and probability of incidence that may be commonly observed in personnel inhaling such doses of agent. The signs and symptoms of each illness are provided separately; they describe the disease progression and are not necessarily correlated with dose…The abbreviations are included to aid medical planners by reminding them of the descriptions and dose ranges described in Tables 3-9 through 3-11.

2. For anthrax (Table 3-9 and plague (Table 3-11, the dose ranges for illness categories are only rough indicators of the early state of illness. Most infected individuals, regardless of dose, will progress through the illness categories to severe illness and death if untreated**.**

Table 3-9. Illness categories from inhalation of anthrax-causing agent (*Bacillus anthracis*).

Category Number	Dose Range[a] (spores)	Signs/Symptoms of Illness	
		Typical Description	Abbreviation
1	$< 10^3$	Most exposed individuals will not be infected. Incidence of infection is 10% at about 1000 organisms inhaled.	No effect
2	$10^3 – 10^4$	Onset of illness 3 - 7 days. Incidence of infection is 50% at about 9000 organisms inhaled. < 15% of untreated personnel will survive.	Mild dose
3	$10^4 – 10^5$	Onset of illness 2 - 5 days; incidence of infection is 90% at about 70,000 organisms inhaled. < 15% of untreated personnel will survive.	Moderate dose
4	$10^5 - 10^6$	Onset of illness 2 - 4 days; < 10% of untreated personnel will survive.	Severe dose
5	$> 10^6$	Onset of illness 1 - 3 days; few untreated personnel will survive.	Very severe dose
Signs and symptoms: Illness begins with a mild headache, a slight cough, and some increased perspiration. The infected individual progresses to significant headache, profuse coughing and sweating, vision difficulty, fatigue, dropping blood pressure and weakening pulse. This is followed by mild to moderate shock, chest pain, possible seizure and coma, cyanosis, and severe dyspnea, leading to death.			

Dose ranges are qualitative; most untreated illness results in death.

Table 3-10. Illness categories from inhalation of botulinum toxin.

Category Number	Dose Range (micrograms / 70 kg person)	Signs/Symptoms of Illness	
		Typical Description	Abbreviation
1	< 0.1	Most exposed individuals will not be affected; incidence of illness is 10% at about 0.09 μg inhaled.	No effect
2	0.1 - 0.75	Vision problems, ptosis; onset of illness 3 - 7 days; incidence of illness is 50% at about 0.24 μg inhaled; incidence of mortality is 10% at 0.5 μg inhaled.	Mild
3	0.75 - 1.5	Muscular weakness, facial paralysis, mild swallowing difficulty, continued ptosis and vision difficulties; onset of illness 2 - 6 days; incidence of mortality is 50% at 1.2 μg inhaled.	Moderate
4	1.5 - 2.3	Respiratory distress, breathing difficulty, muscular weakness, speech difficulty, and moderate to severe swallowing difficulty; onset of illness 1 - 4 days.	Severe
5	> 2.3	Respiratory failure (can't breathe unaided) general muscular weakness, cyanosis; onset of illness 5 hours - 2 days; incidence of mortality is 90% at 3 μg inhaled.	Very Severe

Table 3-11. Illness categories from inhalation of plague-causing agent (*Yersinia pestis*).

Category Number	Dose Range[a] (organisms)	Signs/Symptoms of Illness	
		Typical Description	Abbreviation
1	< 10	Most exposed individuals will not be infected; incidence of infection is 10% at about 10 organisms inhaled.	No effect
2	$10 - 10^2$	Onset of illness 3 - 7 days; incidence of infection is 50% at about 30 organisms inhaled. Most untreated illness results in death.	Mild dose
3	$10^2 - 10^3$	Onset of illness 2 - 5 days; incidence of infection is 90% at about 110 organisms inhaled. Most untreated illness results in death.	Moderate dose
4	$10^3 - 10^5$	Onset of illness 1 - 4 days. Most untreated illness results in death.	Severe dose
5	$> 10^5$	Onset of illness 1-2 days. Untreated illness results in death.	Very severe dose
Signs and symptoms: Illness begins with mild to moderate chills, cough, fever, headache, malaise, myalgia, and disorientation. An infected individual will progress to septic shock, meningitis, stupor, bloody sputum, dyspnea, delirium, and ecchymoses. This is followed by unresponsiveness, cyanosis, coma, circulatory collapse and respiratory failure, leading to death.			

Dose ranges are qualitative; most untreated illness results in death.

3. Tables 3-12 through 3-14 show illness categories for tularemia (*Francisella tularensis*), Staphylococcol enterotoxin B (SEB), and Q fever (*Coxiella burnetii)* by agent exposure ranges and identifies them by an illness category number. Each category and range is followed by descriptions that represent illness effects commonly observed in personnel inhaling such doses of agent…The abbreviations are included to aid medical planners by reminding them of the descriptions and dose ranges described in Tables 3-12 through 3-14.

4. For these three biological agents, the illness categories presented in these tables apply to all estimates involving medical support requirements for casualties in the scenarios considered in this guide. They also apply to the estimation of combat performance of personnel that are expected to remain capable and therefore within their unit at given times.

5. Q fever (Table 3-14) has a low mortality rate, mostly due to patients who develop chronic Q fever resulting in endocarditis. Individuals may develop chronic Q fever months to years after the initial illness. Risk of illness may last as long as 20 years, but is generally about 3 years if treated. Antibiotic treatment is recommended for a minimum of 3 years; patients may relapse if treatment is stopped earlier.

Table 3-12. Illness categories from inhalation of tularemia-causing agent (*Francisella tularensis*).

Category Number	Dose Range (organisms)	Signs/Symptoms of Illness	
		Typical Description	Abbreviation
1	< 10	Most exposed individuals will not be infected; incidence of infection is 10% at 2 organisms inhaled, 50% at 10.	No effect
2	10 - 10^3	Fever 37.8 - 40 °C (100 - 104 °F) with headache, myalgia, malaise, back/chest pain, chills, cough and anorexia; onset of illness 4 to 7 days; incidence of infection is 90% at 45 organisms inhaled; incidence of mortality is 20 - 40%.	Moderate fever
3	10^3 - 10^6	Fever 38.9 - 40.6 °C (102 - 105 °F) with same symptoms as Category 2 plus sore throat, sweating, arthralgia; some nausea and vomiting; onset of illness 2 to 5 days; incidence of mortality is 30 - 50%	High fever
4	> 10^6	Fever > 40 °C (> 104 °F) with same symptoms as Category 3; onset of illness 1.5 to 3 days; incidence of mortality is > 50%.	Severe fever

Fever and onset ranges = 95% confidence limits for population exposed at middle of dose range

Table 3-13. Illness categories from inhalation of Staphylococcal enterotoxin B (SEB).

Category Number	Dose Range (micrograms/ 70 kg person)	Signs/Symptoms of Illness	
		Typical Description	Abbreviation
1	< 0.01	Most exposed individuals will not be affected; at 0.01 μg inhaled, 10 - 20 % may experience some malaise, anorexia and mild headache.	No effect
2	0.01 - 0.10	Fever 38.3 - 40.6 °C (101 - 105 °F) with associated headache and malaise; onset of illness 4 to 12 hours; most will have anorexia, cough, chest pain, muscle aches and weakness for more than 10 to 20 hours; some will have chills, nausea, vomiting, sore throat and arthralgia; incidence of fever is 50% at 0.026 μg inhaled, 90% at 0.09 μg.	Moderate
3	0.1 – 1.0	Severe febrile illness (as above) with increasing incidence and severity of signs and symptoms; pulmonary edema, dyspnea; onset of illness 1 to 6 hours; incidence of mortality is 10% at 0.6 μg.	High
4	> 1.0	Acute respiratory distress, shock and death; incidence of mortality is 50% at 3.3 μg and 90% at 20 μg.	Severe

Fever and onset ranges = 95% confidence limits for population exposed at middle of dose range

Table 3-14 Illness categories from inhalation of Q fever-causing agent (*Coxiella burnetii*).

Category Number	Dose Range (organisms)	Signs/Symptoms of Illness	
		Typical Description	Abbreviation
1	< 30	Most exposed individuals will not be infected; incidence of infection approaches 50% at 30 at organisms inhaled.	No effect
2	$30 – 3 \times 10^3$	Fever 38.3 - 40.6 °C (101 - 105 °F) with headache, myalgia, malaise, back/chest pain, eye pain, chills, cough and anorexia; onset of illness 10 to 18 days; incidence of infection is 90% at 1300 organisms inhaled.	Moderate fever
3	3×10^3 - 3×10^6	Fever 38.3 - 40.6 °C (101 - 105 °F) with same symptoms as Category 2 plus sore throat, nausea, vomiting, arthralgia; onset of illness 7 to 14 days.	High fever
4	$> 3 \times 10^6$	Fever and symptoms as in Category 3; onset of illness 4 to 10 days.	Severe fever

Fever and onset ranges = 95% confidence limits for population exposed at middle of dose range.

6. Tables 3-15 through 3-18 show illness categories for Venezuelan Equine Encephalitis (VEE virus), smallpox, brucellosis and glanders by agent exposure ranges and identifies them by an illness category number. Each category and range is followed by descriptions that represent illness effects commonly observed in personnel inhaling such doses of agent…The abbreviations are included to aid medical planners by

reminding them of the descriptions and dose ranges described in Tables 3-15 through 3-18.

Table 3-15. Illness categories from inhalation of virus causing Venezuelan Equine Encephalitis (VEE).

Category Number	Dose Range (organisms)	Signs/Symptoms of Illness	
		Typical Description	Abbreviation
1	< 2	Most exposed individuals will not be infected; incidence of infection about 10% at 1 organism inhaled.	No effect
2	2 - 10	Onset of illness 3 - 7 days; incidence of infection is 50% at about 3 organisms inhaled.	Mild dose
3	10 - 10^2	Onset of illness 2 - 5 days; incidence of infection is 90% at about 10 organisms inhaled.	Mild/Moderate dose
4	10^2 - 10^3	Onset of illness 2 - 4 days.	Moderate dose
5	> 10^3	Onset of illness 1 - 3 days.	Severe dose
Signs and Symptoms: Illness begins with severe headache, delirium and possible seizures or coma. An infected individual progresses to rigors, fatigue, moderate myalgias, photophobia, stiffness, and severe nausea and vomiting. This is followed by a sore throat, mild frontal headache, weakness and some nausea with toleration of liquid oral intake. During subsequent recovery, an individual will be capable of sedentary activity and moderate physical activity. Mild arthralgia, scratchy throat, agitation and insomnia will occur. No mortality expected.			

Table 3-16. Illness categories from inhalation of smallpox-causing agent (*Variola major*).

Category Number	Dose Range (spores)	Signs/Symptoms of Illness	
		Typical Description	Abbreviation
1	$1 – 10^1$	Most exposed individuals will not be infected. Incidence of infection is 10% at about 10 organisms inhaled.	No effect
2	$10^1 – 10^2$	Onset of illness 10 - 21 days. Incidence of infection is 50% at about 32 organisms inhaled. < 15% of untreated personnel will survive.	Mild dose
3	$10^2 – 10^3$	Onset of illness 8 - 19 days; incidence of infection is 90% at about 100 organisms inhaled. < 50% of untreated personnel will survive.	Moderate dose
4	$10^3 – 10^5$	Onset of illness 7 - 17 days; < 25% of untreated personnel will survive.	Severe dose
5	$\geq 10^5$	Onset of illness 6 - 14 days; < 25% of untreated personnel will survive.	Very severe dose
Signs and symptoms: A febrile prodromal period (temperature usually rising to 38.5°C and 40.5°C) often lasts for two to five days. The febrile illness is often accompanied by influenza-like symptoms including headache and muscular ache. In addition to the fever and rash, backaches, chest pain, chills, headache, conjuctival bleeding, and vomiting may also occur. A centrifugal rash appears at the conclusion of the prodrome. Lesions first appear on the mucous membranes, tongue and palate, as tiny red spots about a day before the rash appears on the skin. The lesions then develop into papules, followed by vesicles on the face and forearms and eventually progress to the distal parts of the extremities.			

Dose ranges are qualitative; most untreated illness results in death.

Table 3-17. Illness categories from inhalation of brucellosis-causing agent (*B. melintensis*).

Category Number	Dose Range (spores)	Signs/Symptoms of Illness	
		Typical Description	Abbreviation
1	1 - 10	Most exposed individuals will not be infected. Incidence of infection is 10% at about 1 organism inhaled.	No effect
2	$10 - 10^2$	Onset of illness 10 - 30 days. Incidence of infection is 50% at about 12 organisms inhaled.	Mild dose
3	$10^2 - 10^3$	Onset of illness 7 - 20 days; incidence of infection is 90% at about 100 organisms inhaled.	Moderate dose
4	$10^3 - 10^5$	Onset of illness 4 - 14 days.	Severe dose
5	$\geq 10^5$	Onset of illness 3 - 8 days.	Very severe dose
Signs and symptoms: Somatic complaints dominate, with fever, malaise, sweats, headaches, arthralgias, myalgia (particularly in the lower back), anorexia, and weight loss among the symptoms most commonly reported. Other symptoms include chills, asthenia, nausea, vomiting, and constipation. Fevers are generally irregular and intermittent, intensity of other symptoms is generally proportional to degree of fever.			

Table 3-18. Illness categories from inhalation of glanders-causing agent (*B. mallei*).

Category Number	Dose Range[a] (organisms)	Signs/Symptoms of Illness	
		Typical Description	Abbreviation
1	1 - 10	Most exposed individuals will not be infected; incidence of infection is 10% at about 10 organisms inhaled.	No effect
2	10 - 10^2	Onset of illness 10 - 20 days; incidence of infection is 50% at about 30 organisms inhaled. Dose ranges are qualitative; most untreated illness results in death.	Mild dose
3	10^2 - 10^3	Onset of illness 6 - 16 days; incidence of infection is 90% at about 110 organisms inhaled. Dose ranges are qualitative; most untreated illness results in death.	Moderate dose
4	10^3 - 10^5	Onset of illness 5 - 13 days. Dose ranges are qualitative; most untreated illness results in death.	Severe dose
5	$\geq 10^5$	Onset of illness is about 4-9 days. Dose ranges are qualitative; most untreated illness results in death.	Very severe dose
Signs and symptoms: Patient presents with vague symptoms such as fever, malaise, loss of appetite, nausea, and headache. Painful nodules and swellings may later appear on the face and limbs and spread rapidly to a general pustular eruption over most of the body. The nasal mucosa becomes reddened and edematous, with ulceration and discharge. In late stages of infection, a severe pyemia develops, with pustules covering the body. Muscular abscesses, pneumonia, diarrhea, and emaciation are seen in the final stages.			

VI. AMedP-8 PERSONNEL STATUS DETERMINATION

Casualty, fatality, and other personnel status were determined based on performance for tularemia, SEB, and Q fever and based on disease progression profiles for the KAMI agents (both described in Section V). Performance calculations and personnel status are based solely on illness progression as a result of exposure; the AMedP-8 calculations do not account for medical treatment. It is assumed that the individual who recovers (convalescent) does so as the signs and symptoms of injury run their natural course; with treatment, this patient and others may potentially recover sooner. Brief descriptions of the personnel status determination methodologies are provided below.

A. PERSONNEL STATUS DETERMINATION FOR NON-KAMI AGENTS

For three agents in AMedP-8 Biological, performance is used a measure to quantify the post-exposure physical effectiveness of an individual. Physical effectiveness is decremented based on the manifestations of physical symptoms which could increase the time required to perform a task correctly. Thus, an individual who is described as 50% capable requires twice as much time to perform a task as required by someone who is 100% capable. Figure VI-1 shows how the personnel status is determined for tularemia, SEB, and Q fever (non-KAMI agents).

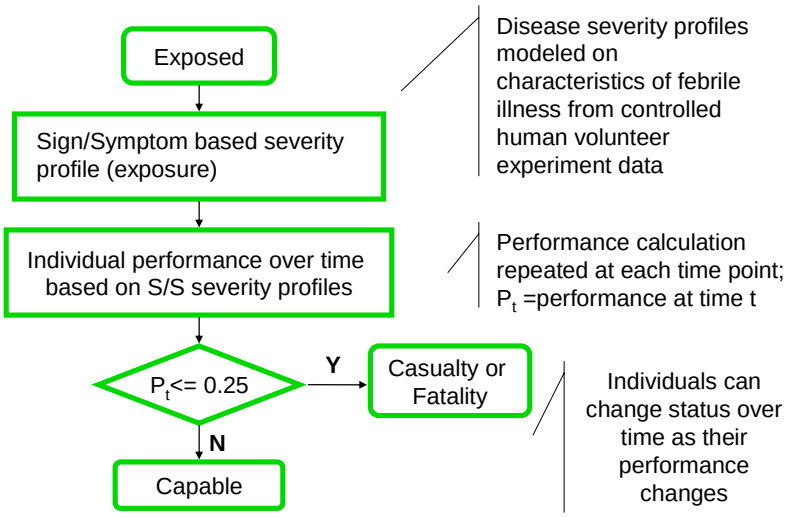

Figure VI-1. Modeling Personnel Status Following Exposure to Body Temperature Profile for Non-KAMI Agents

Utilizing the S/S severity profiles and time- and dose-dependent illness models described in Section V, PSR developed algorithms which estimated the level of performance degradation for tularemia, SEB, and Q fever. These algorithms rely on degradation coefficients empirically derived and corresponding to both cognitive and physical S/Ss which could reduce performance capability. Using a similar methodology as in AMedP-8 Nuclear and Chemical, the degradation coefficients are used to determine a ratio of mean performance change over time based on initial dose and resultant body temperature over time curves.[5]

The performance measure provides the basis for post-exposure physical effectiveness of an individual in AMedP-8.[6] Table VI-1 defines the performance-based categories, including fatalities, casualties, capable, and convalescent, which are used in

[5] There are two important things to note with regard to the performance calculation described above. First, only body temperature was considered as the governing symptom; the impacts of other possible S/Ss—including, but not limited to, headache, malaise, muscle ache, weakness, etc.—were not considered. These S/Ss may play an important factor in determining performance degradation and are not always directly correlated to febrile illness progression. Similarly, these additional S/Ss manifest at different times and in different measure, depending on the initial biological agent; ignoring their impacts on performance may not yield a good picture of performance degradation. Second, the tests selected to determine the degradation coefficients may not sufficiently represent the tasks required of military members. For example, a decrease in hand-grip proficiency may or may not demonstrate a decrease in the ability to load large munitions. Therefore, the resultant performance capabilities may or may not be representative of the actual capabilities of military members to complete their required tasks.

[6] McClellan et al., 1998, p. 17.

the tables described in Sections 3.0 through 3.3 of AMedP-8 Biological. The definitions shown in Table VI-1 apply only to tularemia, SEB, and Q fever.

Table VI-1. Performance Capability Categories

Category	Definition
Fatality	=0% effective
Casualty	>0% but <=25% capable (in medical system until recovery is >=75% or severity level = 1)
Capable	>25% capable
Convalescent	Previously a casualty and subsequently recovers to ≥ 75% effective

An individual whose performance has dropped to 25% capable or below becomes a casualty. Casualty flags are assigned to an individual who becomes a casualty—whose performance drops to 25% or below or whose illness severity indicates a casualty—at any time during the evaluation period. Applying casualty flags to the Illness Category tables, for an illness category of 3 or higher, tularemia has a casualty flag. For all other agents, a casualty flag is assigned for illness categories of 2 and higher.

Over the course of the evaluation period, the individual may remain capable, become a casualty, become a fatality, or recover to convalescence. The individual becomes a fatality if his performance drops to approximately 0%. If the individual's calculated performance improves, the individual can eventually become a convalescent, defined as a one who was previously a casualty (at or below 25% capable) but whose performance increased to greater than or equal to 75% capable. It is assumed that convalescents may require additional medical attention; they should not be expected to return to duty.

B. PERSONNEL STATUS DETERMINATION FOR KAMI AGENTS

To model the fate of personnel after exposure to one of the KAMI agents—anthrax, botulism, plague, VEE, smallpox, brucellosis, and glanders—PSR generated a multi-step model for resultant diseases modeled using the KAMI data, as shown in Figure VI-2.

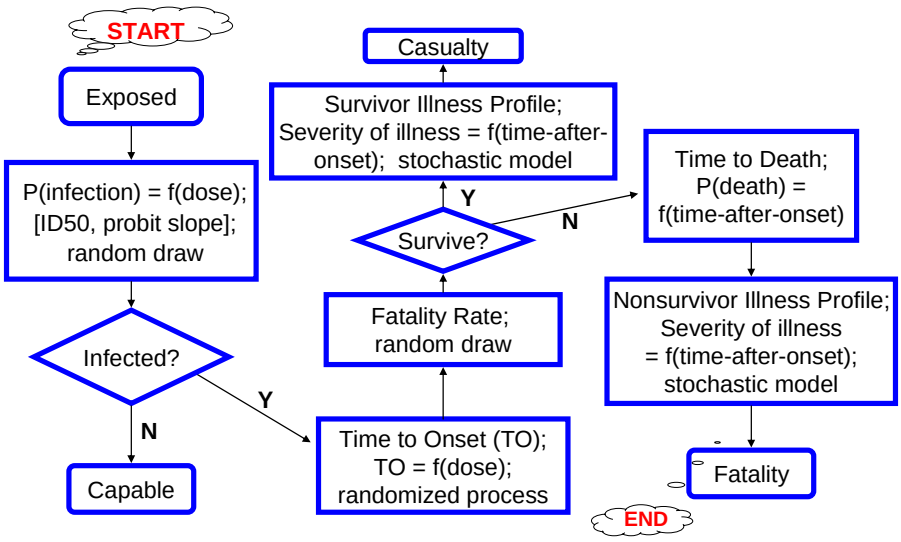

Figure VI-2. Modeling Personnel Status Following Exposure to KAMI Agents

Individuals who are exposed may become infected or intoxicated after agent exposure, which would be expected to result in some capability degradation. Exposed individuals who did not become infected or intoxicated would be considered capable. The probability of infection/intoxication is a function of inhaled dose, as is time to symptom onset.

After onset, progression of illness is described by the disease progression profiles prepared by PSR, as described in Section V. The time to recovery (convalescence) or time to death may be determined by a random draw process or it may be a function of dose, time-after-onset, or some combination of both (depending on the agent and resultant illness).

For KAMI agents, personnel status is determined based on symptom severity, as shown in Table VI-2. Once an individual becomes infected or intoxicated and proceeds through the different stages delineated in the disease severity profile, his status changes to correspond to symptom severity changes over time. A symptom severity of 1 is considered ill but not a casualty. A symptom severity of 2 may be considered either ill or casualty and assigned a casualty flag, depending on the agent (see Table VI-2).[7] For all agents, a symptom severity of 3 or 4 is considered a casualty (and assigned a casualty flag). If the individual's condition improves over time, the individual can eventually

[7] The consideration of casualty was made based on the judgment that these symptoms would render an individual to have an equivalent performance capability of equal to or below 25%. This determination was based on qualitative judgments instead of calculations.

become a convalescent once the symptom severity returns to 1. Note that in AMedP-8 Biological, convalescent individuals are not expected to return to duty, since it is expected that they may require additional medical attention.

Table VI-2. Functional Status of Unit Personnel Based on Symptom Severity

Symptom Severity	Anthrax	Botulism	Plague	VEE	Smallpox	Brucellosis	Glanders
0	Well	Well	Well	Well	Well	Well	Well
1	Ill	Ill	Ill	Ill	Ill	Ill	Ill
2	Casualty	Ill	Casualty	Ill	Ill	Casualty	Ill
3	Casualty	Casualty	Casualty	Casualty	Casualty	Casualty	Casualty
4	Casualty or Fatality	Casualty or Fatality	Casualty or Fatality	Casualty or Fatality	Casualty or Fatality	Casualty or Fatality	Casualty or Fatality

It should be noted that capable is broken into two groups—well and ill. Well individuals would have a symptom severity of zero. Ill individuals may have a low-grade fever and other mild symptoms but are still considered capable. They would have a symptom severity of 1 (or either 1 or 2 for botulism, VEE, smallpox and glanders, see Table IV-2) and not be considered casualties.

This page is intentionally blank.

VII. AMedP-8 EPIDEMIC MODELING

In AMedP-8 Biological, epidemic models were used to assess the spread of contagious diseases, namely smallpox, plague, and the disease of operational significance, influenza. The epidemic modeling efforts were collaborative between IDA and General Dynamics Advanced Information Systems (GDAIS). IDA developed the basic epidemic models for the three contagious diseases of interest,[1] and GDAIS (with assistance from IDA) incorporated these models into the NBC Casualty Resource Estimation Support Tool (NBC-CREST).[2]

The main objective of AMedP-8 epidemic modeling efforts was to quantify secondary or transmission-caused infections due to biological attacks on unprotected forward-deployed military units that comprised the AMedP-8 tactical scenarios. Of particular interest are time histories of four different groups or cohorts: 1) **S**usceptible individuals, 2) **E**xposed (infected, incubating, and non-contagious) individuals, 3) **I**nfectious (symptomatic and contagious) individuals and 4) **R**emoved individuals (who either survive the disease or die from it, and who are no longer sources of infection). The objective "**SEIR**" curves help to define military health care and mortuary service needs as functions of time.[3] In other words, the evolution (as opposed to the spatial or geographical distribution) of initial and transmission-caused infections is emphasized herein.

A military unit like a brigade is a structured population with well-defined subunits that may constrain opportunities for disease transmission. Face-to-face interactions among personnel in the same unit, for instance, generally occur more often than contacts between individuals in different units. Conceivably, certain peacetime activities or wartime operations could mix personnel from different subunits in a homogeneous (or worst-case) fashion. In quantitatively analyzing potential epidemics, impacts of disease

---

2 McClellan, 2005.

3 Within the above-described **SEIR** framework, newly exposed and infected individuals necessitate both an increase in the size of the exposed cohort and an offsetting decrease in the size of the susceptible cohort. Such individuals are members of the exposed cohort throughout their noncontagious latent periods, after which they immediately join the infectious cohort. As members of the infectious cohort, contagious individuals expose and infect susceptible people in accordance with a time-varying rate of disease transmission. Every member of the infectious cohort eventually joins the removed cohort when his or her contagious period comes to an end.

transmission were estimated in both unstructured and structured military populations. However, epidemic modeling results in AMedP-8 Biological apply to unstructured populations (homogeneous mixing).

Another general assumption is that contagious military personnel do not come in contact with civilians. (This is to say, every outbreak of interest is confined to the targeted military unit.) Moreover, assuming disease transmission occurs in accordance with the mass-action law, the time-varying transmission rate for an outbreak depends on average new (transmission-caused) infections per day, corresponding mean-field **S** and **I** cohorts and the total at-risk population. Although this semi-empirical approach doesn't explicitly deal with the spatial spread of disease, historically derived time-varying rates of transmission are implicitly linked with historical spatial influences.

Characteristics of the pathogen, overall susceptibility of the at-risk population, frequency and types of possible contacts between contagious and susceptible individuals, response time of the health care system, prevailing health care practices as well as available prophylactic and therapeutic options are circumstances or conditions that shape any outbreak of disease. Arguably, if the epidemiological circumstances that surrounded a historical outbreak are comparable or compatible with those that could surround a future outbreak, then certain historical disease transmission rates may also have predictive value.[4]

AMedP-8 Biological assumes unique future epidemiological circumstances of most concern will be attributes of the biological attack (nature of the pathogen, inhaled doses, number of initially infected personnel, etc.), the progression of *unnatural initial infections*, and responses of military health care systems. The model is based on the argument that (a) these unique circumstances tend to be incorporable in mean-field epidemic models with historical time-varying transmission rates and (b) this analytical approach to the problem of man-made epidemics yields meaningful estimates for medical planning purposes.

In accordance with Figure VII-1, the identification of pertinent historical outbreaks and the acquisition of suitable epidemiological data are first steps in our semi-empirical approach. An acquired set of epidemiological data then serves as input for

[4] The epidemiological circumstances surrounding a specific historical outbreak are unlikely to be fully reproduced in any future outbreak. A full reproduction of epidemiological circumstances is not under consideration. Rather, the authors contend that early rates of disease transmission for certain historical outbreaks are representative of the early transmission rate in the aftermath of a biological attack.

Monte Carlo calculations that define average new infections per day.[5] By introducing the initial infections and average new infections per day into a mean-field compartmental model, the evolution of all infections in a historical outbreak becomes quantifiable in terms of time-varying **SEIR** cohorts. As mentioned above, given average new daily infections and **SEIR** cohorts for a historical outbreak, the mass-action law allows the calculation of the matching time-varying rate(s) of disease transmission.

The right-hand side of Figure VII-1 indicates that the **SEIR** model for a historical outbreak must be altered to obtain casualty estimates for a potential biological weapon (BW) or biological terrorism (BT) event. But necessary alterations depend on the BW or BT scenario, which describes an adversary's employment of a specific biological weapon against a specific military unit. Of particular interest here are previously analyzed AMedP-8 scenarios involving aerosolized smallpox or plague microbes and a wide array of military targets. As a consequence, for each of these scenarios, the size of the targeted military unit, inhaled doses and the number of initial infections are available (or readily obtainable from NBC-CREST).

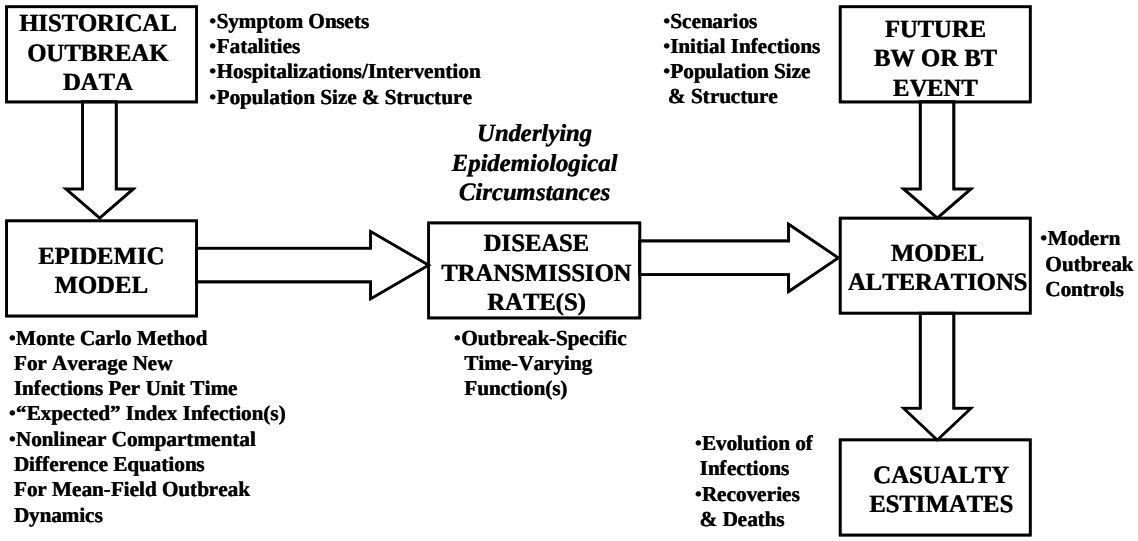

Figure VII-1. Semi-Empirical Approach for Assessing Casualties of Disease Transmission

[5] In the present analytical framework, new infections per day do not include index or initial infections. The person-to-person transmission of a disease gives rise to new infections per day. Index infections happen at the outset of day one (D+1), while new infections per day occur on (D+2) or thereafter, where D represents days.

In moving from the analytical reconstruction of a selected historical outbreak to casualty estimation for a particular AMedP-8 scenario, this methodology calls for the derivation of a time-varying transmission rate that reproduces historical outbreak dynamics in a military population of interest. The first step in this derivation is to determine the mean unnatural (dose-dependent) onset time for the AMedP-8 scenario and then examine the absolute difference between mean unnatural and natural onset times. Second, if that absolute difference is relatively small (less than about 10% of the mean natural onset time), the average number of new daily infections for the natural historical outbreak (with a single initial infection) is also a good approximation for the corresponding unnatural outbreak. And third, a significant absolute difference means that the average number of new daily infections for the natural outbreak must be time-shifted forward or backward to obtain a suitable transmission rate for the unnatural outbreak.

The altered **SEIR** algorithms from above are integrated with NBC-CREST to make casualty estimates for the AMedP-8 scenarios. The process of casualty estimation begins with NBC-CREST calculations of scenario-specific dose-dependent onset times (incubation periods). A mean-field representation of these onset times is then fed into the altered **SEIR** algorithms and the key output is a scenario-specific average new infection rate (average new infections per day). Lastly, the scenario-specific progression of initial infections and the scenario-specific average new infection rate then become input for NBC-CREST casualty calculations. See Figure VII-2, below.

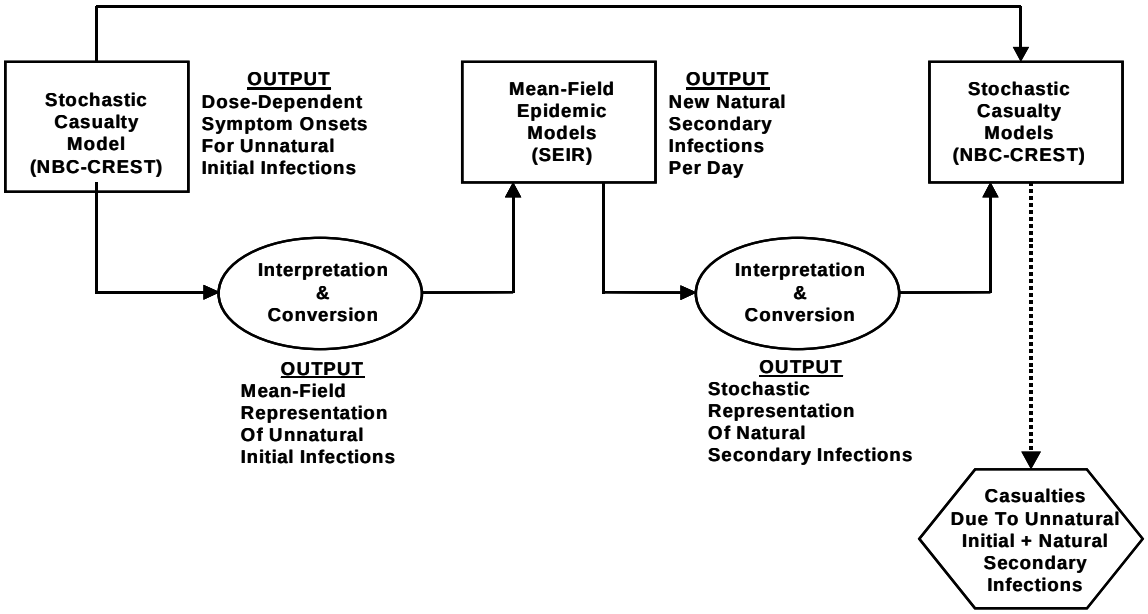

Figure VII-2. Integration of SEIR Algorithms with NBC-CREST: Casualty Estimation Process

VIII. SUMMARY OF CASUALTIES BY SCENARIO

AMedP-8 Biological provides estimates of the numbers, types, and times of casualties resulting from the release of one of 10 biological agents or influenza, by 9 different weapon delivery systems in most cases, and at 3 different attack intensities for each delivery system, for 11 different tactical targets. Tables VIII-1 through VIII-13, below, summarize the results of the analysis documented here. This summary is based on the detailed estimates presented in AMedP-8 Biological. The summary provides the number of infected personnel and number of fatalities for each scenario. Each table summarizes all attacks modeled for one of the 10 biological agents in AMedP-8 Biological and influenza. Shaded cells indicate that the particular scenario was not modeled in AMedP-8 Biological.

Table VIII-1. Number of infected personnel after a *Bacillus anthracis* (anthrax) attack.

IX. AMedP-8 BIOLOGICAL DOCUMENT APPEARANCE

The organization scheme of AMedP-8 Biological[1] is described in this section. That document is organized into 14 sections:

- Section 1: Introduction
- Section 2: Methodology
- Section 3: How to Use Casualty Tables
- Section 4: Anthrax
- Section 5: Botulinum Toxin
- Section 6: Plague
- Section 7: Tularemia
- Section 8: SEB
- Section 9: Q Fever
- Section 10: VEE
- Section 11: Smallpox
- Section 12: Brucellosis
- Section 13: Glanders
- Section 14: Influenza

Sections 1 through 3 provide the background and administrative information necessary to use AMedP-8 Biological. Sections 4 through 14 are each specific to one of the 11 biological agents or diseases and are generally similar in construction, including the tables that provide the data necessary for casualty estimation. Each of sections 4 through 14 is divided into 11 subsections, one for each operational scenario:

- Subsection 1: Heavy Brigade, Forward Maneuver, Movement to Contact
- Subsection 2: Heavy Brigade, Brigade Support Area, Movement to Contact
- Subsection 3: Heavy Brigade, Forward Maneuver, Offense
- Subsection 4: Heavy Brigade, Forward Maneuver, Defense
- Subsection 5: Heavy Brigade, Brigade Support Area, Offense and Defense
- Subsection 6: Support Brigade
- Subsection 7: Light Infantry Brigade
- Subsection 8: Amphibious Assault Force
- Subsection 9: Naval Task Force
- Subsection 10: Air Port of Disembarkation (APOD)
- Subsection 11: Sea Port of Disembarkation (SPOD)

[1] STANAG 2476, AMedP-8(B).

Each subsection contains up to six types of tables. All subsections contain a table providing simple summary estimates of numbers of casualties (see example Table IX-1). Each subsection also contains more detailed tables that give the status of unit personnel by attack intensity (see example Table IX-2), time after exposure (see example Table IX-3), number of casualties with time (see example Table IX-4), or illness category (see example Table IX-5). For contagious diseases, estimates are included for both primary and total numbers of casualties, with and without contagion considered. In addition, subsections 10 and 11 each include a table of multiplication factors that allow the user to estimate casualties among the local civilian population, based on population density. Titles running above tables are designed to help the user quickly find specific information.

Table IX-1. Example of a Number of Infected Personnel Table

Number of Infected Personnel **Heavy Brigade, Forward Maneuver, Movement to Contact (4,042 Personnel Total)** **Tularemia**

X. RECOMMENDATIONS AND CONCLUSIONS

A. RECOMMENDATIONS FOR FUTURE VERSIONS OF AMedP-8 BIOLOGICAL

Upon the review and analysis performed to document the production of AMedP-8 Biological, it became clear that several points may be subject to revision with the production of a new AMedP-8 in the future. Revisions to AMedP-8 would most likely aim to significantly add to the value of the information provided by making that information more accessible and applicable, and/or to extend the information to more situations of interest.

Making information in AMedP-8 more accessible implies changing either the way the information is presented or the format of the document. Currently, the information is presented in a series of tables formatted to permit printing as hard copies. Some reformatting suggestions are:

- Use hypertext to improve user access to information. This would retain the tabular format of the information, but make the electronic access to the data faster by a user interface, which requires a minimum of information to have the desired table display on the screen.
- Incorporate graphical presentation of data. This would supplement the tables with graphs. Some information is easier to grasp graphically. Of course, some information is difficult to graph. Implementing this change could significantly increase the size of AMedP-8. The challenge to the AMedP-8 Custodian is to determine the optimum balance and structure of graphical and tabular data presentation.
- Include supporting algorithms. This would allow the AMedP-8 user to algorithmically estimate performance fraction, fraction ill, time of onset, or time of death for any given exposure level. The difficulty in implementing this change is that there are currently no simple underlying algorithms for the information presented in AMedP-8. Deriving or developing supporting algorithms is associated with significant risk.
- Include supplementary software. This would allow the AMedP-8 user to estimate casualties for a multitude of situations. The difficulty in implementing this format change is that there is currently no generic software that does this. The closest available tool is the Casualty Estimation (CE) module of CREST. If that is not acceptable, it would

most likely be very difficult to develop a completely new software tool that adequately responds to the AMedP-8 users' requirements.

In its current form, AMedP-8 is directly applicable to only the limited number of specific scenarios presented. To make information in AMedP-8 more applicable implies adding more information that responds directly to the specific technical requirements of AMedP-6 and AMedP-7. This additional information could be a compilation of the medical treatment requirements (from AMedP-6) as applicable to the casualties in AMedP-8, or the derivation of an analytic tool or tools, which would depend on the casualty estimates expressed in AMedP-8.

The approach and method underlying AMedP-8 Biological may also need to be revisited. One recommendation is to define the model structure in a STANAG and allow member nations to develop their own planning tools/guides. Also, components of the methodology, especially the human response model, may be revised to account for new information that has become available.

The scenarios used in AMedP-8 are also limited in extent and applicability. The current AMedP-8 estimates casualties from a limited number of applications of military weapons against a limited selection of deployed military force scenarios. Extending the information in AMedP-8 to more situations of interest is one way to expand the utility of AMedP-8. Additional situations could include:

- Additional degrees of injury (negligible, moderate, severe, fatal) subcategories to a "casualty" definition (Each type of injury correlates to specific ranges of exposures, which in turn drive medical system requirements. For example, in the "Severe Injury" category, personnel survive but require skilled medical care for 6 weeks or longer.)
- Consideration of the effects of heat stress, fatigue, and visual decrement due to physical protection
- Additional types of biological agents
- Multiple attacks on single units
- Additional military deployment scenarios
- Additional environments for military operations (urban, forest, etc.)
- Terrorist use of biological weapons against deployed military forces
- Military and/or terrorist use of biological weapons against civilian populations
- Expanded demographic characterization of population
- Impact of protective measures and responses

- Physical protection, especially from tents, vehicles, etc.
- Medical protection
- Technical detection and medical surveillance
- Decontamination
- Medical care.

B. CONCLUSIONS

AMedP-8 Biological added, for the first time, biological casualty estimation to NATO's medical and operational NBC capabilities. Building on the methodology and format developed and used in AMedP-8 Nuclear and AMedP-8 Chemical, it quantifies casualties by level of exposure, and describes the injuries and their effect on personnel performance by time period. The documentation of AMedP-8 Biological provides a starting point for future revisions and will help users better understand its capabilities and limitations. While acknowledging that further work should be pursued to improve its utility, AMedP-8 Biological is a significant step toward preparedness for biological warfare and terrorism.
